Financial support from the MDG Achievement Fund Joint Programme for Children, Food Security and Nutrition and the Federal Ministry for Economic Cooperation and Development of Germany (BMZ) is gratefully acknowledged.

PREFACE

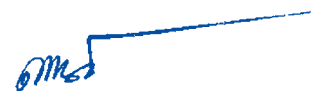

Rapid economic growth in Cambodia is transforming communities in ways unimaginable a decade ago. Yet poverty remains a problem throughout all regions of the country. Ensuring that poor households also experience the benefits of socioeconomic development will continue to require dedicated efforts and innovative solutions from the Royal Government, development partners and other stakeholders.

The Identification of Poor Households (IDPoor) Programme was established in 2006 within the Ministry of Planning to officially establish national procedures for identification of poor households and to realise their implementation throughout Cambodia. Service providers can use IDPoor data to directly target development services and assistance to the poorest households in a village or a geographical area. Such targeted assistance helps to lift poor households out of poverty and to protect them from the impact of shocks which may deepen their poverty.

A primary function of the IDPoor Programme is to provide regularly updated information on poor households to a wide range of Royal Government and non-governmental service providers to assist the planning and implementation of poverty reduction programmes in Cambodia. To date, the IDPoor Programme has fulfilled this mandate by sharing general standardised reports of IDPoor information on CD-ROM and accommodating case-by-case requests for more in-depth access to the information.

The IDPoor Atlas represents the next step in the evolution of information sharing between the IDPoor Programme and service providers. This tool gives users access to recently collected IDPoor information in various new formats maps, tables and charts that enhance its visualisation, comparison, and interpretation. In addition, the IDPoor Atlas provides useful analyses of the underlying socioeconomic characteristics of poor households identified in Rounds 4 (2010) and 5 (2011) that has only recently been made possible through modifications to the IDPoor database. It is hoped that these improvements in presentation and availability of IDPoor data will further promote its usage and facilitate more effective planning and targeting of poverty reduction programmes throughout the country.

I would like to express our appreciation to all the partner organisations that have contributed to the establishment and functioning of the IDPoor Programme. I would also like to thank the World Food Programme for their financial support and Data for Development Consulting for their technical assistance in developing this IDPoor Atlas. Finally, special thanks go out to individuals and communities involved in the implementation of the IDPoor Programme.

INTRODUCTION

Background

Government and non-governmental organisations have been planning and implementing poverty-oriented development programmes in Cambodia for many years. However, the process of identifying poor households for these programmes was not standardised—organisations routinely developed and applied their own procedures and criteria for targeting programme beneficiaries. The result of this was that information collected on poor households was not generally comparable between or shared among various institutions.

To address these problems, the Identification of Poor Households (IDPoor) Programme was established in 2006 within the Ministry of Planning (MoP).¹ Through the IDPoor Programme, the Royal Government of Cambodia aims to more efficiently achieve poverty reduction by providing a national, standardised mechanism for identifying poor households in need of assistance and encouraging the equitable distribution of resources to priority regions. The IDPoor Programme pursues these objectives by:

- Creating a unified system of household poverty targeting;
- Reducing duplication of efforts in targeting the same locations by different agencies;
- Enabling agencies to use limited resources more efficiently;
- Reducing conflict in communities due to community acceptance of results.

The IDPoor Programme produces regularly updated data on poor households for a wide range of Government and non-governmental service providers that allows them to target their services and assistance directly to the poorest and most vulnerable. The system enables two levels of targeting:

1. Geographic Targeting: Household poverty-level information can be aggregated by administrative area (commune, district, and province levels) to compare and identify priority regions for assistance.
2. Household Targeting: Poor households are given Equity Cards that service providers can use to target development assistance to poor households and the individual members within them.

Institutionalisation of IDPoor

The National Social Protection Strategy for the Poor and Vulnerable (2011–2015) recognises the IDPoor Programme as an integral part of the Government’s efforts to reduce poverty, stating:

MoP’s contribution to identifying and targeting the poor through IDPoor is acknowledged as creating the basis for strengthening social protection provision and ensuring a streamlined approach to delivery.²

In December 2011, the Government of Cambodia went further by issuing Sub-decree No. 291, formalising the MoP as the Government agency responsible for Identification of Poor Households and declaring that Government and non-governmental poverty reduction programmes and projects must primarily use IDPoor data as their source for providing services or assistance to poor households.³

¹ Funding and technical assistance for Rounds 4 and 5 were provided by the Royal Government of Cambodia, the Australian Agency for International Development (AusAID), the European Union, the Federal Republic of Germany (technical assistance implemented by Deutsche Gesellschaft für Internationale Zusammenarbeit, GIZ) and UNICEF.

³ See *Sub-decree on Identification of Poor Households* [www.mop.gov.kh].

IDPoor Coverage

Five rounds of the Identification of Poor Households have been conducted since 2007. The first three rounds, from 2007–2009, were implemented jointly by the MoP and partner organisations (NGOs) in a total of 7,114 villages in 17 provinces (some provinces were only partially covered).⁴

Since 2010, the Identification of Poor Households has been coordinated solely through national structures. In 2010, Round 4 of data collection covered 6,441 villages in 11 provinces; in 2011, Round 5 was conducted in another 4,227 villages in 9 provinces (see Figure 1 and Table 1).⁵

Total	155	100	1,241	99.36	10,668	99.2

⁴ The IDPoor Programme classifies the different data collection activities in the provinces as “Rounds”: Round 1 was conducted in 2007, Round 2 in 2008, Round 3 in 2009, Round 4 in 2010, and Round 5 in 2011. Most areas of Kampong Cham, Kampong Thom, and Stung Treng were covered during Rounds 1–3; IDPoor data for these three provinces will be updated during Round 6 (2012). For more information on administrative areas covered during Rounds 1–5, visit the IDPoor Programme’s website [www.mop.gov.kh].

⁵ The Identification of Poor Households only covered rural areas during Rounds 1–5; the MoP plans to develop a tool and process for identifying poor households in urban areas in the near future.

Starting from 2012, the IDPoor Programme plans to update its information on poor households for all administrative areas every three years. The implementation schedule takes into account service providers' need for up-to-date information and maximises the population covered each year given the available resources.

IDPoor Procedures

The Identification of Poor Households follows a 7-step process that emphasises full participation of the communes and validation of the results by village members⁶ (see Figure 2).

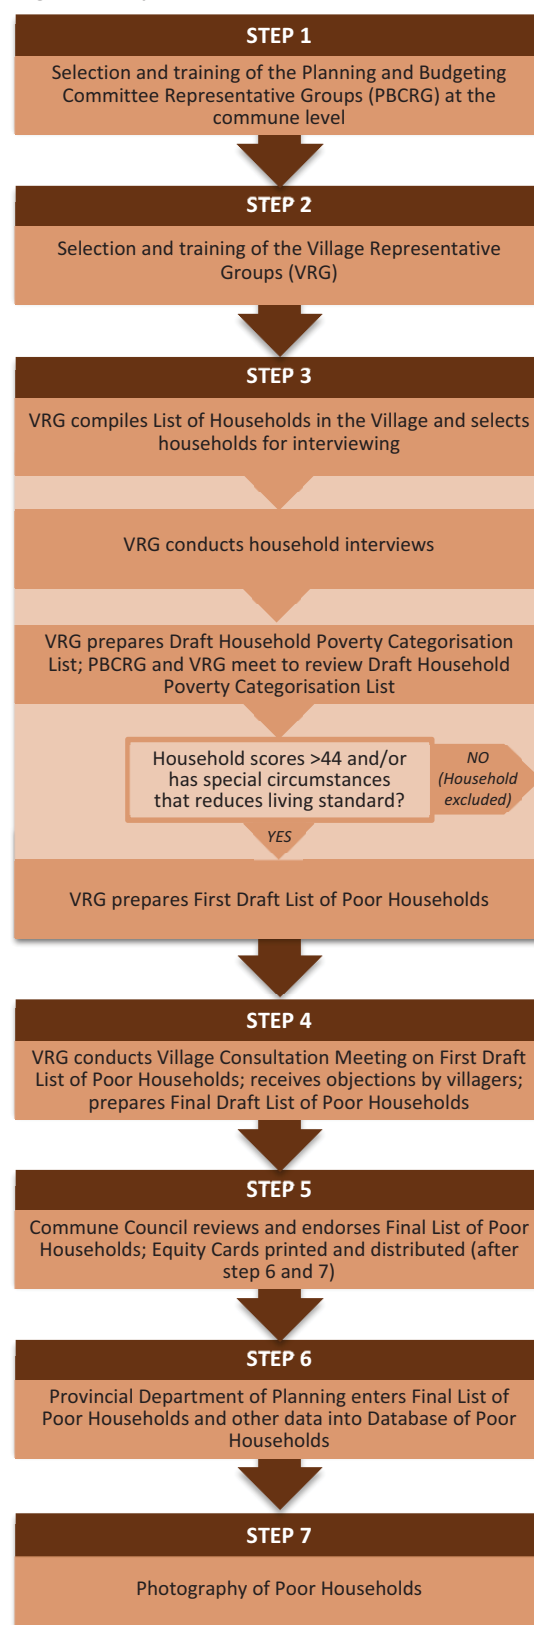

Household Questionnaire Scoring System

In Step 3 of the process, a Village Representative Group (VRG) selects and interviews households using a standard household questionnaire⁷; interviews are conducted by VRG members themselves, whose local knowledge makes it easier to verify whether respondents are accurately reporting their situation, as well as to assess the special circumstances of households.

The household questionnaire aims to optimise comparability of the identification results between households and administrative areas. The household questionnaire is divided into four sections (A, B, C, and D). Sections A and B record administrative and demographic information of the households, respectively.

Section C of the household questionnaire collects information regarding various socioeconomic characteristics of poverty which are easily observable and verifiable, including household construction materials, main income activity, asset ownership, and dependency ratio. Responses to these questions are weighted and summed to produce an IDPoor Score for every interviewed household, whereby the highest IDPoor Scores are associated with the poorest households.⁸

Figure 2. Steps for Identification of Poor Households

⁶ See *Implementation Manual on the Procedures for Identification of Poor Households* [www.mop.gov.kh].

⁷ See *Household Questionnaire for Identification of Poor Households* [www.mop.gov.kh].

⁸ The weights given to each question were determined in close consultation with communities throughout Cambodia; as such, the contribution of a socioeconomic characteristic to a household's IDPoor Score conveys the relative importance of the characteristic in understanding poverty as defined by the communities themselves.

Special Household Circumstances

In addition to the IDPoor Score generated from Section C, the household questionnaire includes a fourth module (Section D) that allows the VRG to assess whether special circumstances exist within the household that could affect its poverty status. The questions collect information pertaining to any major crises the household might have recently faced, school absences by household members aged 6–11 years, and circumstances that could either reduce or improve the household's living standards (e.g. head of household is disabled or a widow with 3 or more small children or remittances from children or relatives).

Determination of Household Poverty Level

IDPoor Score cut-offs have been established to classify households according to three poverty categories: "Poor Level 1" (59–68 points, "very poor"), "Poor Level 2" (45–58 points, "poor"), and "Other" (< 45 points, "not poor"). In addition, households identified to have special circumstances are reviewed by the VRG to determine whether the circumstances impact their poverty status. Following this step, a First Draft List of Poor Households is prepared and publicly displayed in the community for villagers' review. The VRG then organises a Village Consultation Meeting to receive villager objections to the First Draft List that will inform any final changes to the households' poverty status. The VRG then produces a Final List of Poor Households that is submitted to the Chief of Commune Council for endorsement. The process results in a List of Poor Households that categorises households as either Poor Level 1 or Poor Level 2.

IDPoor Atlas⁹

In an effort to expand the amount of IDPoor data available to service providers for programme planning and targeting, in 2011 the IDPoor Programme partnered with World Food Programme to modify the existing Database of Poor Households to accommodate the additional information collected in Sections C and D of the household questionnaire.

In May 2012, as a means of promoting the utilisation of IDPoor data in accordance with Sub-decree No. 291, the MoP and WFP collaborated to make recently collected IDPoor data (2010 & 2011) available in a format that encourages more effective targeting of poverty reduction programmes in Cambodia.

That effort resulted in the production of this IDPoor Atlas. The IDPoor Atlas is a planning tool which has as its main objective the presentation of IDPoor information in a way that facilitates its use by service providers for planning their poverty reduction programmes. Achieving this objective required condensing the available IDPoor data and distilling its main findings into one location for programme managers and decision-makers alike. The two key elements of this process involved:

1. Presenting 2010–2011 IDPoor data in a format that emphasised maps, graphs and tables to enhance visualisation, comparison and interpretation;
2. Conducting more extensive analyses of IDPoor data from Sections C and D of the household questionnaire to explore and synthesise the key characteristics of poor households according to poverty category, main income activity, and administrative area.

The IDPoor data and analyses contained in this hard-copy IDPoor Atlas are presented at the national, provincial, and district levels. The IDPoor Programme plans to make these data and analyses available at the commune level via digital format in the near future.

⁹ The term *Atlas* represents a concept and refers to a book or bound collection of maps, tables and charts to illustrate a particular subject.

METHODOLOGY

Secondary Analysis of Sections C & D

In order to explore the underlying characteristics of poor households, descriptive statistics were first produced of the data from Sections C and D of the household questionnaire and disaggregated according to poverty category, main income activity (i.e. growing rice, fishing, or other), and administrative area. The descriptive statistics were presented in this fashion because these classifications represent, from a poverty reduction perspective, the most useful segmentations for programme planning and targeting available in the IDPoor data.

After obtaining a basic overview of the IDPoor data, the various socioeconomic characteristics of poverty queried in Section C were categorised into four main groups (each of which were composed of one or more subgroups) to explore whether the frequency of these characteristics varied according to poverty category, main income activity, and administrative area (see Table 2).

Table 2. Socioeconomic Characteristic Analysis (Sub)Groups

Socioeconomic Group	Socioeconomic Subgroup	Socioeconomic Characteristics
Housing	Housing	Roofing material
		Wall material
		Condition of house
		Floor area of house
Ownership	Assets	Owns radio, mobile phone, battery charger, etc.
	Livestock	Raises fish and/or owns pigs, cows, buffaloes, etc.
	Transportation	Owns bicycle, motorbike, boat, etc.
Productivity	Active Members	Members cannot produce income
	Income Generation	Grows rice, fishes, other
Food Security	Food Security	Borrowed rice in last 12 months

To assess the variation in frequency, the scores of each subgroup were summed and divided by the total score possible for that subgroup. This *percentage of maximum subgroup score* was computed for each subgroup and compared by poverty category, main income activity, and administrative area. The percentage of maximum subgroup score (P) was calculated according to:

$$P = \frac{\sum_{i=1}^n x_{s,i}}{n \times x_{s,\max}}$$

n – number of households in an administrative area
 $x_{s,i}$ – household questionnaire score for subgroup s of household i
 $x_{s,\max}$ – maximum possible score for subgroup s

With this information, service providers whose poverty reduction programmes target specific socioeconomic characteristics of poverty can assess in which administrative areas these characteristics appear most frequently and target programme resources accordingly.

Next, the four main groups were assessed to determine whether their contribution to the IDPoor Score varied according to poverty category, main income activity, and administrative area. These percentage contributions to IDPoor Score (C) were calculated according to:

$$C = \frac{\sum_{i=1}^n x_{g,i}}{\sum_{i=1}^n X_i}$$

n – number of households in an administrative area
 $x_{g,i}$ – household questionnaire score for group g of household i
 X_i – total IDPoor Score for household i

Structure of IDPoor Atlas

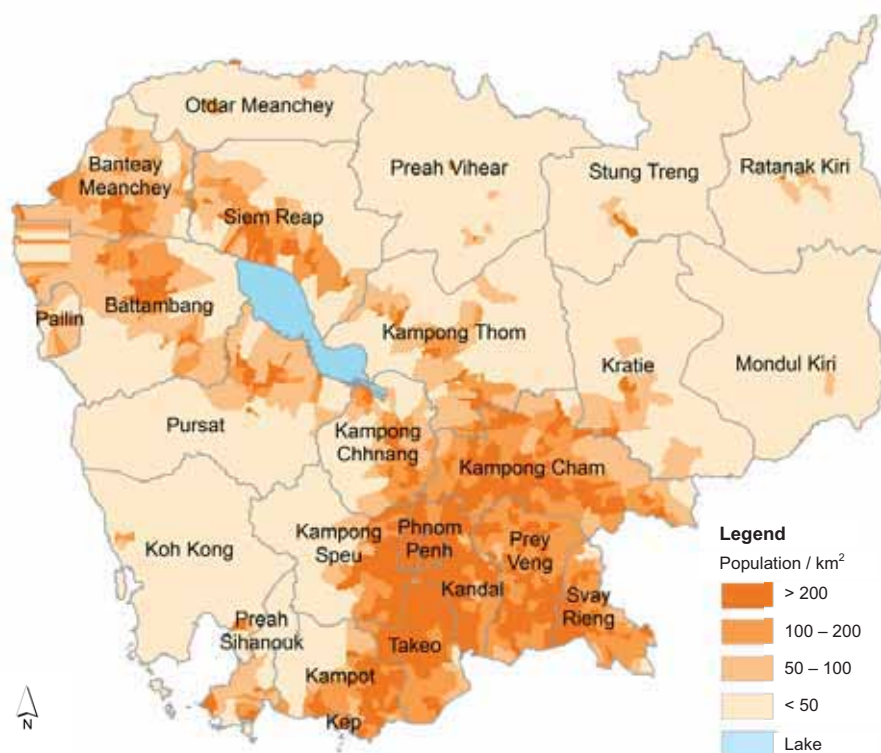

The IDPoor Atlas was designed to provide users with both a snapshot and more in-depth view of the Identification of Poor Households data from 2010 and 2011. The first two sections present information on poor households at the provincial and district levels, respectively, structured according to a four-page repeating pattern:

1. Page A contains a map showing the percentage of poor households by administrative area;
2. Page B provides more detailed information on the classification of poor households in table and chart format by administrative area;
3. Page C contains a map showing the number of poor households by administrative area;
4. Page D displays more detailed analyses of the underlying socioeconomic characteristics of poor households in table and chart format by administrative area.

The final section provides a more exhaustive overview of all the poor household data collected from the household questionnaire by administrative area, including expanded analyses of the information captured in Sections C and D (socioeconomic characteristics and special circumstances) and a breakdown of the distribution of poor household members by age and sex.

To better interpret the IDPoor data presented in the following sections, it is necessary to understand the geographical distribution of Cambodia's population. Figure 3 below shows the population density by commune to provide this important context.

Figure 3. Population Density by Commune (Population Census, 2008)¹⁰

¹⁰ General Population Census of Cambodia 2008. National Institute of Statistics, Cambodia.

DISCUSSION

One finding of the secondary analysis was the inability to form generalisations about the underlying socioeconomic characteristics of poor households. Because information from Sections C and D of the household questionnaire was only entered for poor households into the Database for Poor Households, it was not possible to compare the frequency and distribution pattern of socioeconomic characteristics between poor and non-poor households. In the future, the socioeconomic information for non-poor households will be needed in order to identify distinctions that could be exploited for planning and targeting poverty reduction programmes.

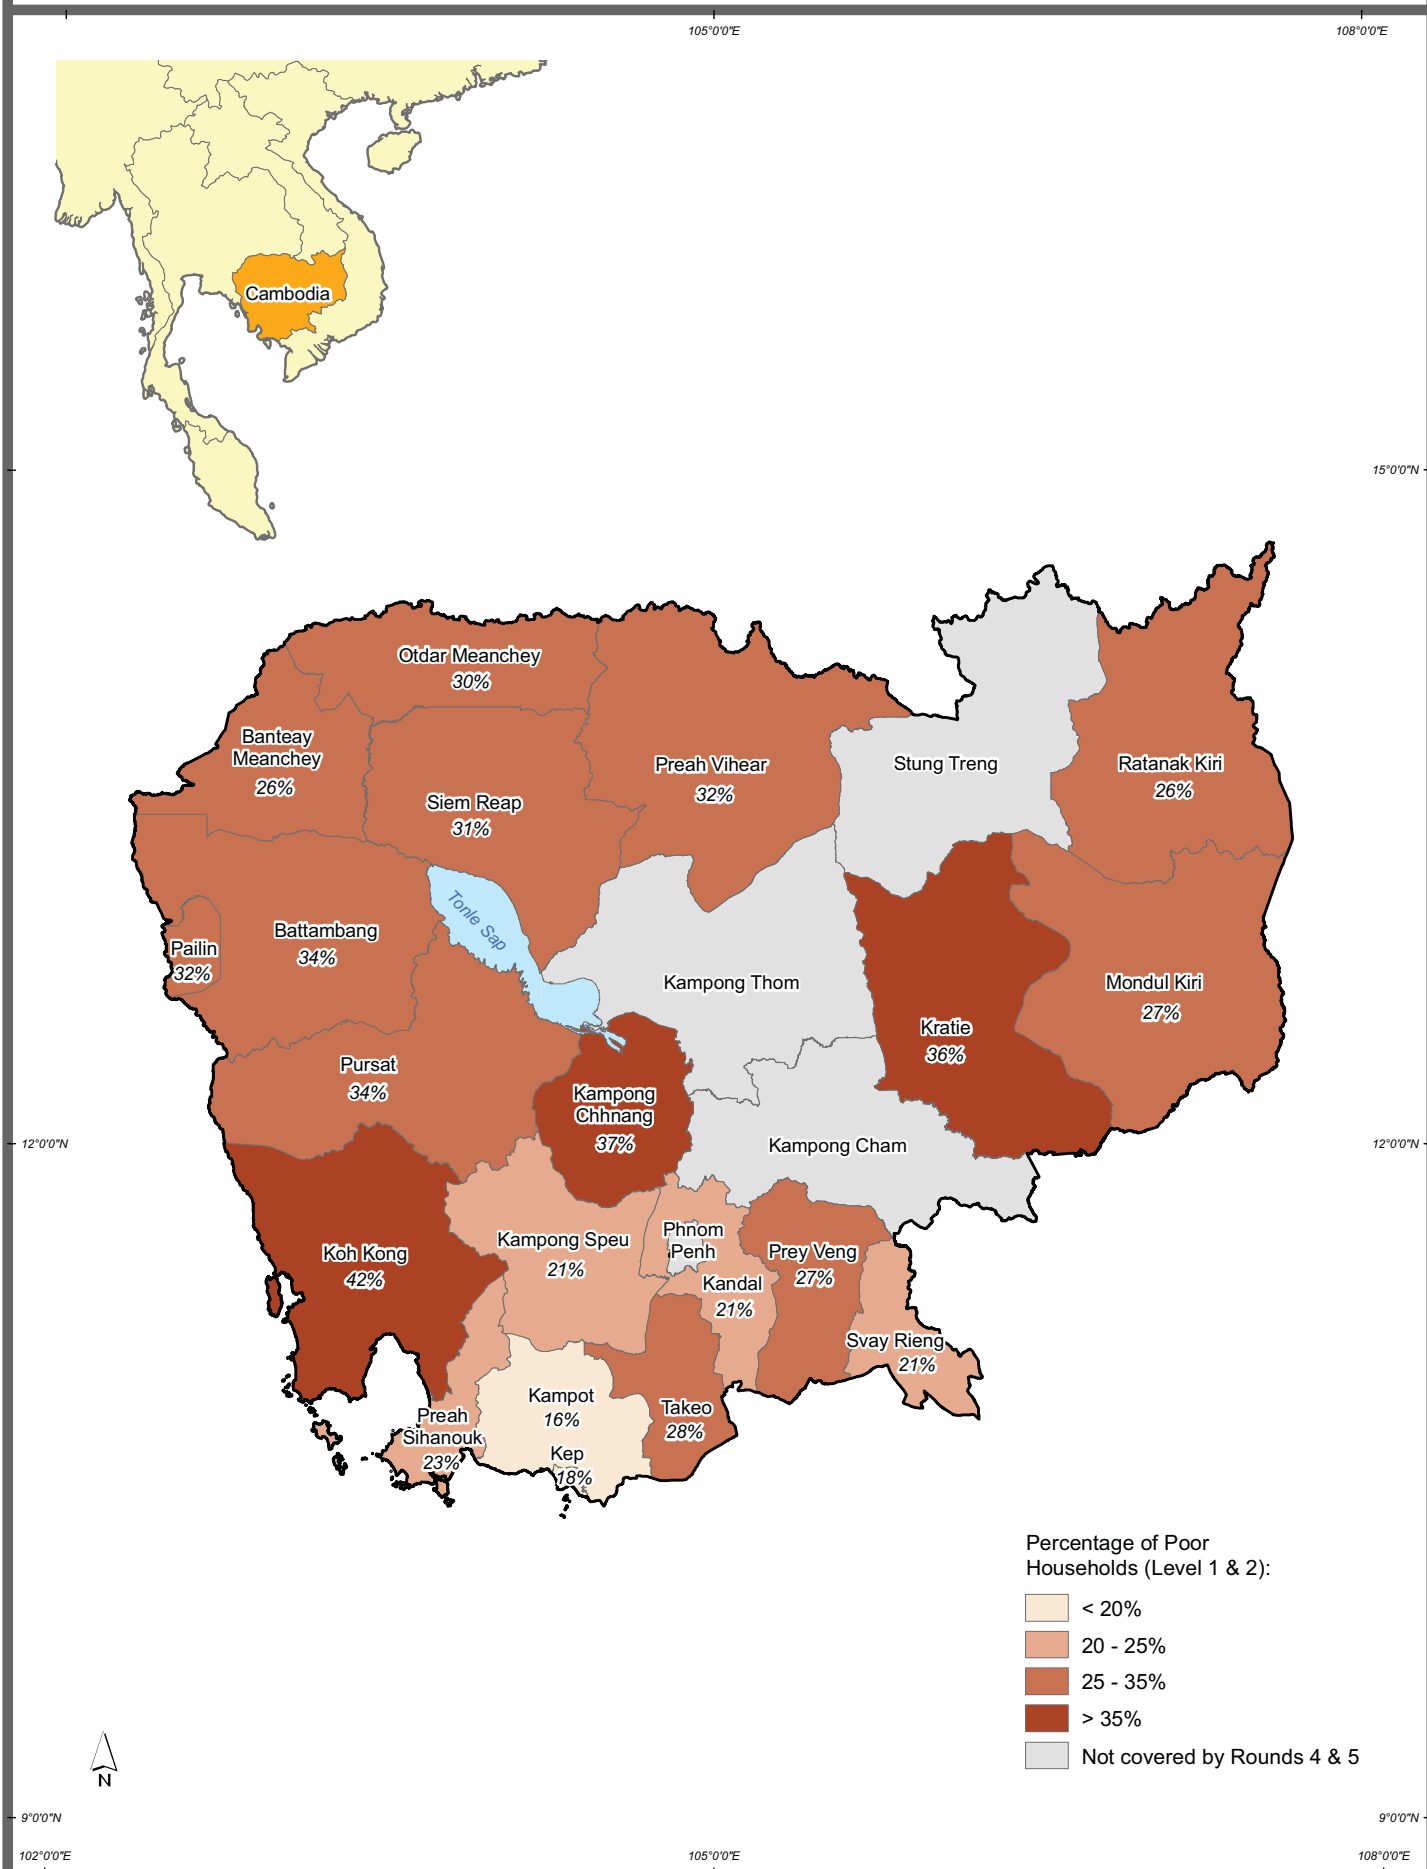

Furthermore, outside of special circumstances, a household must score at least 45 points in Section C of the household questionnaire to be categorised as Poor Level 1 or Poor Level 2. Since the range of possible points in Section C is 0–68, this meant that the actual range of IDPoor Scores that could be analysed was quite narrow (45–68; mean: 57). Because there are only 10 scoring questions in Section C, and the range of their weights is quite broad (e.g., responses to Question 7 are weighted 0, 5 or 10), the narrow range of high scores observed could only have resulted from a very small set of response variations to individual questions. As a result, it was very difficult to highlight interesting patterns according to socioeconomic characteristics and special circumstances between poverty category, main income activity, and administrative area.

Nevertheless, a primary interest of the secondary analysis was to identify any differences between Poor Level 1 and Poor Level 2 households that might inform the design of poverty reduction programmes. At the national level, the largest difference in the underlying socioeconomic characteristics of Poor Level 1 and Poor Level 2 households was observed within the Food Security subgroup (23-percentage-point difference). This finding suggests that, at the national level, the most consistent socioeconomic characteristic associated with Poor Level 1 households was the amount of time a household owed or borrowed rice from other households in the 12 months preceding the interview. The next most reliable predictor of Poor Level 1 status was Income Generation, such that households with a large proportion of members unable to produce an income (e.g., due to young or old age, poor health, or disability) were more likely to be categorised as Poor Level 1. It is important to note, however, that the patterns of these underlying socioeconomic characteristics fluctuate according to administrative area, and service providers are encouraged to interpret specific findings in a way that best supports their planning and targeting needs.

A map of South Africa with its provincial boundaries outlined in white. The map is set against a solid orange background. A dark grey horizontal bar is positioned across the middle of the map, containing the title text in white.

A map of a region, likely in South Africa, showing the boundaries of various districts. The map is rendered in a light beige color against a solid orange background. The boundaries are irregular and follow the natural contours of the land. A dark grey horizontal bar is superimposed over the center of the map, containing the title text.
