

GENERAL STATISTICS OFFICE

THE 1/4/2010 POPULATION CHANGE
AND FAMILY PLANNING SURVEY

MAJOR FINDINGS

HANOI, 2-2011

INTRODUCTION

On 25 February 2010, the General Statistical Office's Director General issued the Plan of the 1st April 2010 population change and family planning survey. The survey is conducted on an annual basis with the purpose of collecting information on population, population changes (birth, death, migration) as well as basic information on contraceptive use and abortion.

Since the 1999 Population and Housing Census, there has been a remarkably increasing demand for information on population changes and contraceptive use. Policy makers, development planners, researchers, international organizations and mass media have always requested to provide key data collected from the survey. Survey data has helped the Party and Government agencies at the central level assess the implementation of key population indicators, trend and socio-economic characteristics of the population.

Results from the 1999 and 2009 Population and Housing Censuses and annual population change and family planning surveys conducted since 2001 have provided data users with reliable and comparable data extending over a period of 10 years. However, the 2010 sample survey is even more ambitious than the previous sample surveys: its questionnaire was added with new questions and its sample size was also widened.

This report has been prepared with a great effort to provide as much information as possible to data users. Part I contains a description of the 2010 population change and family planning sample survey, including important technical issues. Part II present sample results together with the key analytical data. It is hoped that they will meet the users' basic needs. Potentially, sample can produce many more data tables to meet specialized demand, but the main objective of Part III is to timely present most fundamental data tables. More detailed data can be tabulated from survey micro-data files when users have demand.

It is necessary to emphasize that this report presents results of a sample survey, the majority of its results is reliable but some might suffer from sampling errors, so attention should be paid when interpreting results.

This publication was completed with technical and financial support of the United Nations Population Fund (UNFPA). We would like to express our sincere thanks to staffs of the UNFPA Office in Vietnam for their great contribution to the edition and finalization of the report.

Even though we have tried hard, it is hardly free from errors in data collection and compilation. The General Statistics Office hope that this report will meet basic demands for information from researchers and socio-economic policy makers, especially from those whose work relates to population and family planning issue and warmly welcome all constructive comments from readers.

TABLE OF CONTENTS

Introduction.....	iii
Table of contents.....	v
PART I: DESIGN AND IMPLEMENTATION	1
I. SURVEY ORGANIZATION	3
1. Objectives and demands of the survey.....	3
2. Respondent and enumeration unit.....	3
3. Contents of the survey.....	4
4. Recruitment and train for field workers.....	4
5. Fieldwork and quality control.....	5
6. Data processing.....	6
7. Calculation of sampling errors	6
II. SAMPLE DESIGN AND ESTIMATION.....	8
1. Sample frame	8
2. Determination of sample size and sample allocation	9
3. Sample estimation	9
PART II: MAJOR FINDINGS	13
I. POPULATION SIZE AND STRUCTURE.....	15
1.1 Household size.....	15
1.2 Population size.....	16
1.3 Population distribution.....	17
1.4 Population structure by sex	17
1.5 Population structure by age.....	18

II. MARITAL STATUS	20
2.1 Trend in marriage.....	21
2.2 Singulate mean age at marriage by residence, region and province	23
2.3 Adolescent marriage.....	25
III. EDUCATION.....	27
3.1 School attendance	27
3.2 Gross and net enrolment rates	28
3.3 Literacy	30
3.4 Educational attainment.....	31
IV. FAMILY PLANNING AND REPRODUCTIVE HEALTH.....	33
4.1 Implementation of family planning	33
4.2 Reproductive health care	39
V. FERTILITY	43
5.1 Total fertility rate	43
5.2 Age-specific fertility rates	46
5.3 Crude Birth Rate	47
5.4 Provincial differentials of fertility	48
5.5 Proportion of women having third and higher order births	49
5.6 Sex ratio at birth.....	51
5.7 Knowing the sex of the fetus before delivery.....	53
VI. MORTALITY	55
6.1 Crude death rates.....	56
6.2 Infant mortality.....	57
6.3 Levels of mortality by province	58
6.4 Cause of death	58
VII. MIGRATION AND CHARACTERISTICS OF MIGRANTS	60
7.1 Inter-regional migration.....	60
7.2 Inter-provincial migration	62
7.3 Rural – Urban migration flow	65
7.4 Major characteristics of migrants.....	66

PART III: TABULATED TABLES	69
Table 1: Population by urban/rural residence, sex, socio-economic region and province/city, 1/4/2010.....	71

PART I

DESIGN AND IMPLEMENTATION

I. SURVEY ORGANIZATION

1. Objectives and demands of the survey

The 1/4/2010 population change and family planning survey is to collect the following information:

- Population and population change;
- Current use of contraceptive methods, menstrual regulation and abortion;

The information is presented for each centrally governed province/city, urban/rural areas and the whole nation.

2. Respondent and enumeration unit

The survey cover all households and usual residents of sample enumeration areas, all births and deaths occurred in the duration from 1st date of “Ky Suu” Lunar New Year 2009 (that is, the 26th February 2009) to the end of March 31 2010; and all movements into the sample enumeration areas during the period mentioned above in selected sample enumeration areas.

The enumeration units are households. A household is a social unit comprises either one person living alone or a group of person living in the same dwelling and sharing meals together, without regard to whether they are in a flesh and blood relation or not, or whether they share a common incomings and outgoings budget, or the combination of the two.

Head of the households (or adults who have deep awareness of the household's members) is the one who provide key information. Regards to some information that heads of the households do not know well, enumerators must directly interview the investigation objects.

Particularly regards to questions of child-bearing and the current use of contraceptive methods, enumerators will directly interview women aged 15-49 years old or currently married women aged 15-49.

3. Contents of the survey

Besides identification information, survey contents include the following key information (Annex 1 – the Questionnaire):

Part 1: General information on population

For all population: Full names of usual residents; relationship to the head of household; sex; month and year of birth (or age); ethnicity; migration status.

For persons aged 5 years and over: adding information on current school attendance; highest educational level attained.

For persons aged 15 years and over: adding information on marital status, month and year when the current marital status occurred.

Part 2: Information on fertility, family planning and reproductive health of women aged 15-49 years

- Number of children ever born, number of children died and information on the last birth;
- Antenatal status and sex of birth;
- Contraceptive use, menstrual regulation and induced abortion.
- Complication occurring after menstrual regulation and induced abortion.

Part 3: Information on the household's deaths

- Number of deaths;
- Sex, time of deaths and age of deaths;
- Reason of deaths.

4. Recruitment and train for field workers

Enumerators are the direct force to implement the survey and play a very important role to the quality of information gained in particular and to the success of the surveys in general. Hence, a compulsory demand is to choose those who are highly responsible, have educational level of high school and over (in the difficult situation, high school educational level is accepted) and have been trained carefully. Each enumerator takes responsibility of one locality. Birth, marriage and death

recorders or population specialized officers should not be chosen to be enumerators and in the best case, enumerators should be females. Provinces/cities need to use enumerators who have participated in the recent surveys.

Team leaders are the force that directly controls the daily task of each enumerator, decides the sufficiency and accuracy of the information collected. Each team leader takes responsibility of 2-3 enumerators.

Supervisors are organized for all three levels of Central, province and district. They are Statistical officers who directly participate in this survey. Provincial/district supervisors must examine supervision process of team leaders and support them in accomplishing their tasks.

In urban areas, we can hire guidance. In remote and mountainous areas, guidance who is simultaneously interpreters can be used to support enumerators.

Trainings for the fieldworkers will be conducted in two steps:

- *Step 1*: General Statistical Office organized 2 training courses for centrally governed province/city staffs (one for the North provinces/cities and one for the South provinces/cities), each course lasts for 3 days in the early March of 2010.

- *Step 2*: Provincial Statistical Offices organized a training course for enumerators, team leaders and supervisors (include backup enumerators and team leaders), each course lasts for 4 days in the late March of 2010. In the training courses, we should also combine with interviewing practice and training, and questionnaire record.

5. Fieldwork and quality control

The fieldwork was conducted for about 15 days, starting from 1/4/2010 and ending on 20/4/2010 for the latest. Each enumerator is assigned to enumerate on an average of 6 households per day, however in the first 2 days one should not exceed 4 households/day/enumerator in order to help the enumerator correct errors, especially system errors in questionnaire record and interview.

Everyday, enumerators conduct interview and questionnaire records under strict control and guidance of the team leaders. Apart from the task of observing and checking the work of enumerators, team leaders are given the responsibility to

conduct random spot checks to make sure that all enumerators had performed their task with high standards.

After the questionnaires had been checked and edited at the field, questionnaires are transferred to the Provincial Statistics Offices, where the questionnaires are checked again, mainly focusing on logical examination. After that, all the questionnaires are sent to three GSO's statistics informatics center (Hanoi, Da Nang and Ho Chi Minh City) as plan to entry and tabulate data.

6. Data processing

Data entry and questionnaire edit are carried out at three GSO's statistical informatics centers in Hanoi, Da Nang and Ho Chi Minh City. These centers are combined to establish a computer network to process survey data, including a server and a number of personal computers. The networks in Da Nang and Ho Chi Minh City are connected with the Center in Hanoi.

A number of consistency checks are carried out, and followed by data edition. As soon as the data entry for a province was completed, a list of inconsistencies was printed out for verification and correction, and then data files were updated with these corrections.

7. Calculation of sampling errors

Estimates from the sample survey were affected by two types of error: (1) non-sampling error, and (2) sampling error. Non-sampling error is the result of errors in implementation of data collection and processing such as visiting the wrong dwelling, interviewing the wrong household, mis-understanding of questions by respondents, other errors on the part of respondents or enumerators and wrong data entry. Although many efforts were made to minimize these errors while implementing the survey, non-sampling errors cannot be completely avoided are difficult to evaluate statistically.

On the other hand, sampling error can be evaluated statistically. The sample of respondents in the sample survey is only one of many possible samples that could be selected from the total population using the same sample design method and required sample size. Each of these possible samples could give different results from the sample actually selected. Sampling error results from variation in results from the

many different possible samples. Although it is not possible to know this variation precisely, it can be estimated from the sample survey results.

Sampling error is usually measured using *standard errors* for specific statistical indicators (mean, percentage, etc). The standard error is, in fact, the square root of the variance. Standard errors can be used to calculate confidence intervals which contain the true value for the population. For example, for a given statistical indicator calculated from the sample survey, the true statistical value will fall within the interval plus or minus two times the standard error for that indicator with confidence equal to 95% for all possible samples of the same size and sample design.

If the sampling unit is selected following simple random sampling, then it is possible to use formulas to directly calculate standard errors for the sample. However, the sample of the 1/4/2010 population change and family planning survey was designed with strata, and therefore a more complicated formula must be used. Computer software that could be used to calculate standard errors for stratified samples includes the standard error calculation module of ISSA or STATA. These programs use the *Taylor linear expansion* method to estimate variance for estimates of means and proportions for sample surveys.

The Taylor linear expansion method considers the mean or proportion as a ratio estimate, $r = y/x$, for which y is the total sample value of variable y , and x is the total number of events in the group or sub-group being studied. The variance of r is calculated using the following formula, where standard errors are the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

where:

$$z_{hi} = y_{hi} - rx_{hi}, \text{ and } z_h = y_h - rx_h$$

In which:

h - indicates the strata ranging from 1 to H ,

m_h - is the total number of enumeration areas selected in strata h ,

y_{hi} - is the total of weights of variable y for enumeration area i , in strata h ,

x_{hi} - total number of weighted events in enumeration area i in strata h , and

f - the overall sampling rate, (if this value is very small it can be dropped).

Sampling error in the sample survey is calculated for a few selected key indicators. Results are presented in an Annex for estimates at the national, urban and rural, and 6 socio-economic region levels and for 63 provinces/cities. For each variable, the statistical estimate (R), standard error (SE), relative standard error (SE/R) and 95% confidence interval ($R \pm 2SE$) are presented in Annex 2.

In order to facilitate in-depth studies on sample reliability of some key indicators, sampling errors were calculated for the following variables:

- Total dependency ratio;
- Ageing index;
- Literacy rate of population aged 15 and over;
- Literacy rate of male population aged 15 and over;
- Literacy rate of female population aged 15 and over;
- Gross enrolment rate at primary;
- Net enrolment rate at primary;
- Gross enrolment rate at lower-secondary;
- Net enrolment rate at lower-secondary;
- Gross enrolment rate at higher-secondary;
- Net enrolment rate at higher-secondary;
- Any contraceptive prevalence rate;
- Modern contraceptive prevalence rate;
- Percentage of women giving birth to three children or more.

II. SAMPLE DESIGN AND ESTIMATION

1. Sample frame

The sample of the 1/4/2010 population change and family planning survey is the stratified sample, represents for provincial level. Each centrally governed province, city constitutes a main stratum with two sub-strata of urban areas and rural areas. The sample frame are sample enumeration areas of the 2009 Population and Housing Census.

2. Determination of sample size and sample allocation

To ensure an obtainment of sample estimates representative for provinces, the sample was allocated inversely to population size. As a result, each province had a sample size of about 60 enumeration areas with an average of 100 households per enumerator area. Hanoi and Ho Chi Minh City are the two most populous and complicated cities, so they had a selection of 74 enumerator areas. Provinces with smaller population size also had a sample size of nearly 60 enumerator areas (refer to Annex 3).

The sample of the survey was a stratified cluster sample, in which each province constituted the main clusters (63 strata) with two sub-clusters within each representing “urban” and “rural” areas. The allocation of sample units in each stratum was done using the systematic random sampling method.

3. Sample estimation

The general weights can be calculates from the following probabilities/weights:

- 1) Design weights (basic weights): depend on probability;
- 2) Coefficients used to adjust weights due to variations in the number of households or variations in the total number of enumeration areas because of lost but not replaced by other ones;
- 3) Coefficients used to adjust weights according to structure of the population under study (self-weighting).

Notations:

W_{1hji} - Design weights (basic weights) of j^{th} EA, h^{th} stratum;

W_{2hji} - Coefficients used to adjust weights due to variations in the number of households (persons);

W_{3hji} - Coefficients used to adjust weights according to the average number of households in EA of h^{th} stratum;

W_{4hji} - Coefficients used to adjust weights due to variations in the number of enumerator areas;

W_{5hji} - Coefficients used to adjust weights according to structure of the universal;

W_{hji} - Weights for the number of households or male/female population of j^{th} EA, h^{th} stratum.

Determination of basic weights

According to the sample design, the 2010 population change and family planning survey was conducted on a sample size almost equal throughout all 63 provinces/cities. Each province/city conducted interviews to about 24,000 persons.

Suppose a_h is the number of EA selected in the h^{th} stratum and N_h is the total number of EAs of h^{th} stratum. Because the sample was selected independently for each stratum according to the systematic random sampling method, so the basic selection probability is calculated by the formula: $P_{1hji} = \frac{a_h}{N_h}$ and the basic weight (design weight) of the j^{th} EA, h^{th} stratum is the inverse of the selection probability, which was calculated as follows:

$$W_{1hji} = \frac{1}{P_{1hji}} = \frac{N_h}{a_h} \approx \frac{M_h}{\sum m_{hj}}$$

In which, M_h is the total number of households (persons) of h^{th} stratum and $\sum m_{hj}$ is the total number of households (persons) of all selected EA in the h^{th} stratum.

Determination of coefficients used to adjust weights due to variations in the number of households (persons) and the number of EAs

a) Adjustment of weights due to variation in the number of households (persons):

Suppose m_{hj} is the total number of households (persons) at the time that j^{th} EA, h^{th} stratum carried out its listing and m_{hj}^* is the total number of households (persons) at the time that j^{th} EA, h^{th} stratum conducted its enumeration. Because EAs in each stratum is selected with equal probability and were selected from the 2009 Census sample frame, and coefficients used to adjust the weights due to variation in the number of households (persons) will be calculates by formula:

$$W_{2hji} = \frac{1}{P_{2hji}} = \frac{m_{hj}}{m_{hj}^*}$$

As the 2009 census's enumerator areas were created with unequal size, so it is necessary to determine coefficients used to adjust the size of each of 2009 Census EAs to be equal to the average size of EAs in that stratum. Suppose \bar{m}_{hj} is the average number of households (persons) of EAs in h^{th} stratum, then the coefficients used to adjust the weights due to variation in the number of households (persons) will be calculated by formula:

$$W_{3hji} = \frac{1}{P_{3hji}} = \frac{\bar{m}_{hj}}{m_{hj}}$$

b) Adjustment of weights due to variation in the number of EAs:

It was stipulated in the 1/4/2010 survey that if a selected EA was found to be destroyed or cleared away during the update of maps and lists, the unit would be replaced by a neighbor to keep the total number of selected EAs in the stratum unchanged, hence :

$$W_{4hji} = \frac{1}{P_{4hji}} = 1$$

Determination of coefficients used to adjust weights by structure of the universal (weights by proportion of the studied population)

The annual average population is estimated by urban/rural and sex for each of 63 provinces/cities, so it could be weighed according to proportions of urban and rural population, and male and female population. Suppose m_{hji}^* is the total number of households (population by male/female) recorded by enumerators for j^{th} EA, h^{th} stratum ; m_{hji}^{**} is the total number of households (population by male/female) adjusted according to proportions of urban/rural population and proportions of male/female population of j^{th} EA, h^{th} stratum, then it is calculated by formula:

$$m_{hji}^{**} = m_{hj}^* \times \frac{M_{hi}^*}{M_h^*}$$

In which:

m_{hj}^* Total number of households (population by male/female) provided by the sample survey for j^{th} EA, h^{th} stratum;

M_{hi}^* Total number of households (population by male/female) by urban/rural area estimated as of 1/4/2010 for h^{th} stratum ($i = 1 - \text{urban}; i = 2 - \text{rural}$)

M_h^* Total number of households (persons) estimated as of 1/4/2010 for h^{th} stratum.

Coefficient used to adjust weights according to structure of the population (households) estimated as of 1/4/2010 are determined as follows:

$$W_{5hji} = \frac{1}{P_{5hji}} = \frac{m_{hji}^{**}}{m_{hji}^*} \times \frac{M_h^*}{M_h} = \frac{m_{hj}^*}{m_{hji}^*} \times \frac{M_{hi}^*}{M_h^*} \times \frac{M_h^*}{M_h} = \frac{m_{hj}^*}{m_{hji}^*} \times \frac{M_{hi}^*}{M_h}$$

As the sample allocation is not proportional to the population, so weights will be calculated to be used in analyzing the results of the 2010 o1 change and family planning survey to ensure an actual representation of the sample.

The weight for each household (or population) in urban area (i) of j^{th} EA, h^{th} stratum is the inverse of selection probability:

$$W_{hji} = 1/P_{hji} = W_{1hji} \times W_{2hji} \times W_{3hji} \times W_{4hji} \times W_{5hji}$$

$$W_{hji} = 1/P_{hji} = \frac{M_h}{\sum m_{hj}} \times \frac{m_{hj}}{m_{hji}^*} \times \frac{\bar{m}_{hj}}{m_{hj}} \times \frac{m_{hj}^*}{m_{hji}^*} \times \frac{M_{hi}^*}{M_h} = \frac{\bar{m}_{hj}}{\sum m_{hj}} \times \frac{M_{hi}^*}{m_{hji}^*}$$

The Department of Population and Labor Statistics of the GSO has, in close cooperation with the Center of Statistical Informatics, calculated all the above mentioned weights for 3,890 EAs sampled in this survey.

PART II

MAJOR FINDINGS

I. POPULATION SIZE AND STRUCTURE

The 2010 population change and family planning sample survey covered all people usually residing in households of sampled enumeration areas as of reference time-point (0 hour, 1st April 2010). These people were recorded according to household, which is defined as including one or a group of people who live together and share meals. Households, usual residents directly managed by the military and police forces but usually residing in households of sampled enumeration areas were also covered in the survey.

1.1 Household size

TABLE 1.1: PERCENTAGE DISTRIBUTION OF HOUSEHOLDS BY HOUSEHOLD SIZE AND AVERAGE HOUSEHOLD SIZE BY URBAN/RURAL AND SOCIO-ECONOMIC REGION, 1/4/2010

Residence/socio-economic region	Distribution of household size (%)					Average household size (persons)
	1 person	2–4 persons	1–4 persons	5–6 persons	7+ persons	
Entire country	7.1	65.0	72.1	22.9	5.0	3.8
Northern Midlands and Mountains	5.2	63.7	68.8	23.9	7.2	4.0

Mekong River Delta	7.1	63.5	70.6	22.4	7.0	3.9
Rural	6.7	63.9	70.6	24.3	5.0	3.9
Northern Midlands and Mountains	4.2	60.9	65.2	26.3	8.5	4.2
Red River Delta	9.5	69.1	78.6	19.2	2.1	3.5
North and South Central Coast	7.1	60.9	68.1	27.1	4.8	3.9
Central Highlands	4.1	56.3	60.4	30.3	9.3	4.3
Southeast	6.6	65.9	72.6	22.8	4.6	3.7
Mekong River Delta	5.4	63.9	69.3	25.3	5.5	4.0

The results of the 2010 population change survey shows that average household size reached 3.8 persons. Household size of urban and rural areas is 3.7 persons and

3.9 persons, respectively. It is similar to results of the 2009 Population and Housing Census. Average household size of the Vietnam's population has continuously decreased. Specifically, those figures in 2001, 2003, 2005 and 2006 are 4.5 persons, 4.4 persons, 4.3 persons and 4.1 persons, respectively. The Red River Delta has the lowest average household size in the country (3.5 persons). The region with the largest household size is the Central Highlands (4.2 persons).

In entire country and in each of the 6 socio-economic regions, the number of one-person households (single households) and the number of households with 7 or more members accounts for a very small share of the total. Small family size (households with 4 or fewer members) is very common in Vietnam (72%), especially in urban areas (75%). There is variation in household size across regions. The Central Highlands has the lowest share of households with 4 or fewer members (64%), and it is also a region with a high concentration of ethnic minority people, who tend to have high fertility and traditions favouring multi-generational families. For all remaining regions, the share of households having 4 or fewer members is more than 68%.

1.2 Population size

Total population of Vietnam on 01 April, 2010 was 86,747,807 persons, an increase of 900.8 thousand persons as compared to 01 April, 2009. The population in urban areas was 25,923,749 persons, accounting for 29.9% of the total population. The male population is 42,878,963 persons, accounting for 49.4% of total population. The most heavily populated region is the Red River Delta (19,729,612 persons), followed by North and South Central Coast (18,911,046 persons). The Central Highlands is the least populated region with 5,203,606 persons.

TABLE 1.2: POPULATION SIZE BY SEX, URBAN/RURAL RESIDENCE
AND SOCIO-ECONOMIC REGION, 1/4/2010

Socio-economic region	Total	Male	Female	Urban	Rural	<i>Unit: Persons</i>
Entire country	86 747 807	42 878 963	43 868 844	25 923 749	60 824 058	
Northern Midlands and Mountains	11 150 794	5 572 048	5 578 746	1 774 027	9 376 767

1.3 Population distribution

With population density of 262 persons/km², Vietnam is one of the most densely populated countries in the region and in the world. Vietnam's population density is the third in Southeast Asia only after the Philippines (313 persons/km²) and Singapore (7,526 persons/km²) and stands 16th out of 51 nations and territories in Asia. Population density of the Red River Delta is the highest in the country at 937 persons/km², followed by the Southeast with population density of 614 persons/km². These 2 regions contain 39% of the entire population of the country, but only comprise 13% of total land area. Population density of the Central Highlands is 95 persons/km², the lowest in the nation. This shows that the Vietnamese population is not evenly distributed and there is large regional variation.

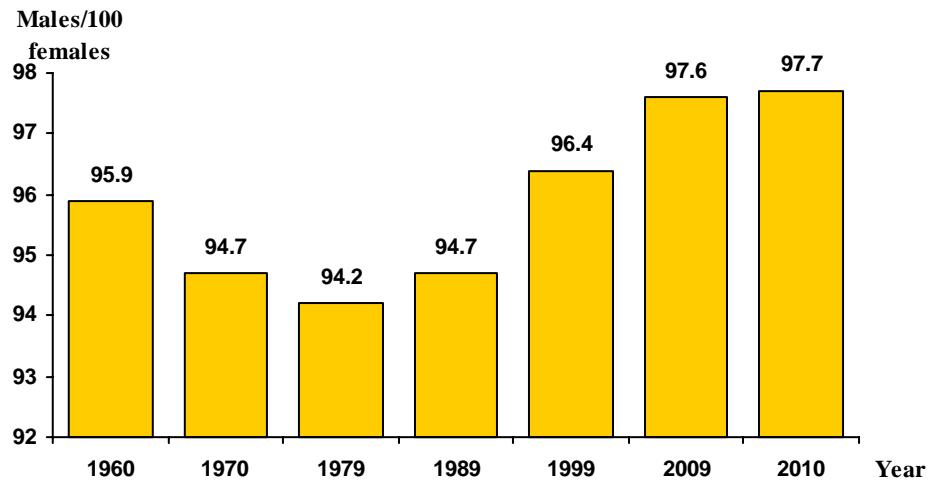

TABLE 1.3: PERCENTAGE DISTRIBUTION OF LAND AREA, POPULATION AND POPULATION DENSITY BY SOCIO-ECONOMIC REGION, 1/4/2010

Socio-economic region	Area (%)	Population (%)	Population density (Persons/km ²)
Entire country	100.0	100.0	262
Northern Midlands and Mountains	28.8	12.9	117
Red River Delta	6.4	22.7	937
North and South Central Coast	29.0	21.8	197
Central Highlands	16.5	6.0	95
Southeast	7.1	16.7	614
Mekong River Delta	12.2	19.9	426

1.4 Population structure by sex

Population sex structure is measured by the sex ratio that is defined as the number of males per 100 females. The sex ratio of total Vietnam population has always been less than 100. Apart from main cause (male mortality has exceeded female mortality) this phenomenon of Vietnam has been strongly affected by wars in the 20th century. However, this figure has been gradually increasing since 1975, after Vietnam was unified. Specifically, the sex ratio collected from censuses in 1989, 1999 and 2009 and the 2010 population change survey are 94.7; 96.4; 97.6 and 97.7 males/100 females, respectively.

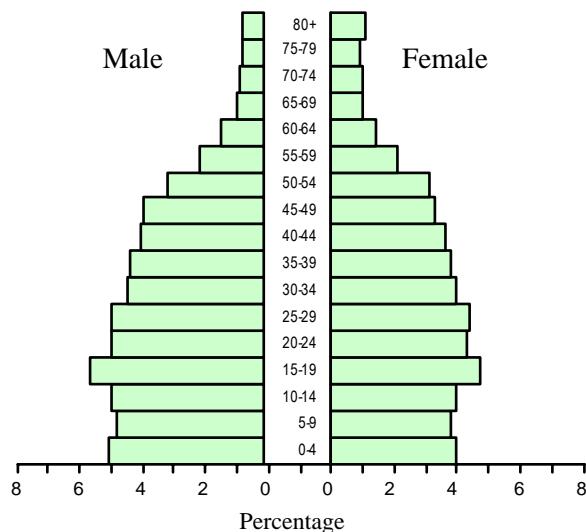

Figure 1.1: Sex ratio of the Vietnamese Population, 1960 - 2010

1.5 Population structure by age

The sex and age structure of the population reflects an overall picture of fertility, mortality and population increase of the previous birth cohorts up to the point-time of the 2010 survey. One useful tool for describing the age and sex structure of the population is the age pyramid or namely the population pyramid. Figure 1.2 presents the Vietnam Population Pyramid using data from the 2010 population change survey.

Figure 1.2: Vietnam Population Pyramid, 2010

As fertility has declined substantially in recent years, while life expectancy at birth continues to increase, Vietnam's population is beginning to age, with the

proportion of the population in young ages declining and the proportion in older groups continuing to increase. The narrowing of three bars at the base of the pyramid for both males and females is evidence that fertility in Vietnam has seen continuous and rapid declines.

TABLE 1.4: PERCENTAGE DISTRIBUTION OF POPULATION BY SEX AND SEX RATIO BY AGE GROUP, 1/4/2010

Age group	Overall	Male	Female	Sex ratio	<i>Unit: Percent</i>
Total	100.0	100.0	100.0	97.7	
0-4	8.4	8.9	7.9	111.0	
5-9	8.0	8.4	7.5	109.8	
10-14	8.4	8.8	7.9	108.3	
15-19	9.7	10.0	9.3	105.0	
20-24	8.6	8.6	8.6	98.2	
25-29	8.7	8.7	8.7	97.7	
30-34	7.9	8.0	7.8	99.4	
35-39	7.6	7.7	7.4	101.0	
40-44	7.1	7.1	7.1	97.8	
45-49	6.7	6.8	6.5	102.3	
50-54	5.8	5.4	6.2	85.1	
55-59	4.0	3.7	4.2	87.7	
60-64	2.6	2.3	2.8	81.0	
65+	6.8	5.5	8.0	66.8	

The age structure of the population is also used to calculate dependency ratios, indicators of the burden on the population in working ages. These indicators reflect the influence of fertility and mortality on age structure and the labour force. The total dependency ratio represents the number of the population under age 15 (0-14) and age 65 and older per 100 people aged 15-64.

The data show that the total dependency ratio in Vietnam has declined rapidly over time. The total dependency ratio fell from 78% (in 1989) to 64% (in 1999). By 2010, this ratio had continued to decline to 46%. This decline is mainly from the effect of family planning due to reductions in fertility leading to child dependency ratios declining, life expectancy at birth is increased and the elderly live longer. This again confirms that Vietnam's fertility has fallen continuously over the past 20 years. At the same time, this indicates that the burden on the population able to work continues to decline. Due to the results of population ageing, the aged dependency ratio has increased slightly starting in 1989, and hopefully it will continue to increase in the coming years.

TABLE 1.5: DEPENDENCY RATIO, 1989-2010

Unit: Percent

Dependency ratio	1989	1999	2009	2010
Child dependency ratio (0–14)	69.8	54.2	35.4	36.1
Aged dependency ratio (65+)	8.4	9.4	9.3	9.9
Total dependency ratio	78.2	63.6	44.7	46.0

Table 1.6 reflects even more clearly the population ageing trend mentioned above. The share of the population below 15 years of age has declined from 33% in 1999 to 25% in 2010. Average life expectancy at birth of the population continues to increase, raising the proportion of the population aged 65 years and older. In 1999, the proportion of the population aged 65 and older was 6%, while in the 2010 it had increased to nearly 7%.

TABLE 1.6: PROPORTION OF POPULATION AGED UNDER 15, 15-64 AND 65 AND OLDER AND AGEING INDEX, 1989 - 2010

Unit: Percent

	1989	1999	2009	2010
Proportion of population under 15 years	39.2	33.1	24.5	24.7
Proportion of population 15–64 years	56.1	61.1	69.1	68.5
Proportion of population 65 years and older	4.7	5.8	6.4	6.8
Ageing index	18.2	24.3	35.5	37.9

One of the important indicators to show population ageing is the ageing index, which is the ratio of the number of people aged 60 and older per 100 people aged below 15 years. This indicator reflects the dependency structure of the population. The ageing index has increased from 18% in 1989 to 24% in 1999, and reached 38% in 2010. This shows that population ageing in Vietnam has been taking place very rapidly over the past two decades.

II. MARITAL STATUS

In the 1/4/2010 population change and family planning sample survey, two questions were used to collect information on current marital status of persons aged 15 years and over: (i) current marital status; and (ii) month and year of the occurrence of that marital status.

A person is considered “married” if that person is recognized by law or by habit, custom as married or currently living with a partner of the opposite sex as

husband or wife. The marital status of a person only belongs to one of the following two categories: ever married, including those who have married at least once; and never married. Ever married persons include those who are currently married, widowed (persons whose husbands or wives have died, but who have not married yet), divorced (persons who have been divorced by law and have not remarried yet) and separated (persons who have been married, but are not currently living with their partner as husband and wife at the time of the survey). The second group only consists of never-married persons at the time of the survey.

2.1 Trend in marriage

Table 2.1 shows the percentage distribution of population aged 15 and over by marital status and age group. Proportion of currently married population aged 15 and over has been relatively high for the past years. Table 2.1 indicates that 68% of males and 64.3% of females are currently married. Proportion of never-married male is 6.6 percentage points higher than that of females (29.0% versus 22.4%).

The survey reveals a difference in nuptiality between urban and rural areas. Proportion of single population aged 15 and over in urban areas is higher than that of rural areas (29% in comparison with 24.1%). Percent of currently married population in rural areas is 67.6%, which is 5 percentage points higher than that of urban areas (62.6%).

TABLE 2.1: PERCENTAGE DISTRIBUTION OF POPULATION AGED 15 YEARS AND OVER BY MARITAL STATUS, SEX AND URBAN/RURAL RESIDENCE, 2010

Unit: Percent

Residence/sex	Marital status				
	Total	Never Married	Currently Married	Widowed	Divorced/ Separated
Entire country	100.0	25.6	66.1	6.6	1.7
Male	100.0	29.0	68.0	2.0	1.0
Female	100.0	22.4	64.3	11.0	2.3
Urban	100.0	29.0	62.6	6.2	2.2
Male	100.0	31.7	65.3	1.7	1.3
Female	100.0	26.6	60.2	10.1	3.1
Rural	100.0	24.1	67.6	6.9	1.4
Male	100.0	27.9	69.2	2.0	0.9
Female	100.0	20.4	66.2	11.5	1.9

In general, in Vietnam, proportion of divorced/separated population is low but there is a differential in divorce by sex and urban, rural areas. Proportion of divorced/separated females is higher than that of males. For both men and women, the

rate of divorced/separated in urban areas is as one point five times as that in rural areas. This may be because economic conditions of urban residents, especially women, are more economically independent than that of rural areas so urban population accepts divorce more easily.

Marriage in Vietnam is found to be nearly universal particularly among males. Nearly all men are ever-married some time in their life. In the age group 50-54, 98.6% of males are ever-married while 5.6% of females are single.

Figure 2.1 shows that, generally females entered into marital union earlier than males although male's marriage is more universal than that of female. Proportion of ever-married females is higher than that of males for ages under 30. In the youngest group 15-19, only over 2% of males are ever-married, while 8.7 out of 100 females are ever-married at these ages. For the 20-24 age group, percentage of ever-married females is twice higher than that of male (49.6% in comparison with 24.6%). After age 35, proportion of ever-married females becomes lower than that of males. For the last age group of reproductive period 45-49, 6.1% of females are still never-married.

In the age group 15-49, 61.3% of males are currently married and that figure of females is 66.2%. Feature of marriage in Vietnam is that proportion of currently married females little by little increases from the age of 15 to 39, but after this age this figure gradually reduces immediately after age 40. Percent of currently married males has only declined after age 60.

Figure 2.1: Proportion of single population aged 15 and over by age and sex, 2010

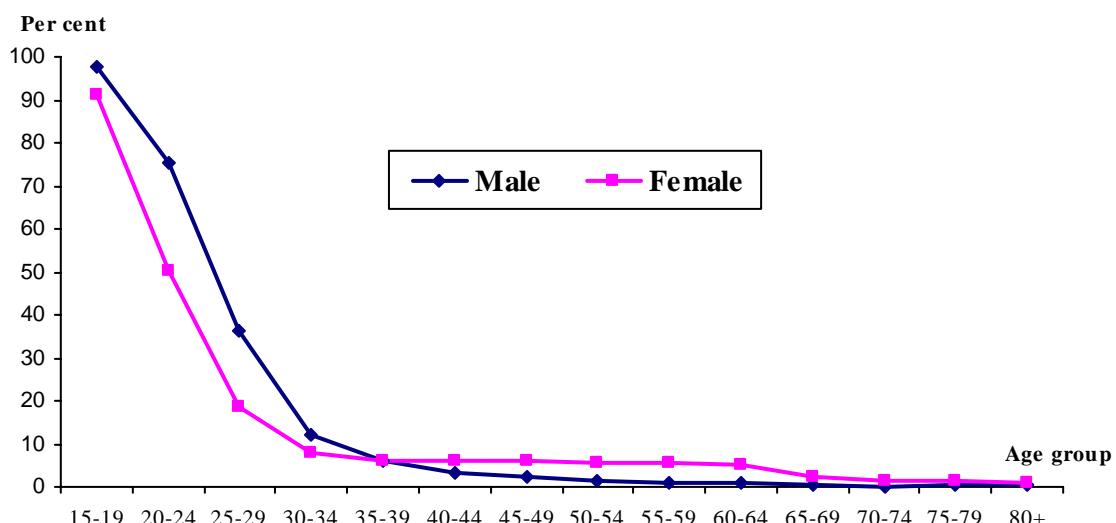

Table 2.2 presents percentage distribution of population aged 15 years and over by marital status and socio-economic regions of the entire country. Proportion of single population is highest in the Southeast in comparison with other regions, followed by the North and South Central Coast. The Southeast includes provinces and cities such as Ho Chi Minh City, Dong Nai, Ba Ria-Vung Tau and Binh Duong, which are rated as areas with dynamic economic activities and therefore attracting most of investment projects in the entire country. Employees who are mainly young workers in its own regions and from neighbouring ones have been attracted to work offered in the Southeast. The majority of these young employees are single because they wish to get a permanent job.

TABLE 2.2: PERCENTAGE DISTRIBUTION OF POPULATION AGED 15 YEARS AND OVER BY MARITAL STATUS AND SOCIO-ECONOMIC REGIONS, 2010

Unit: Percent

Socio-economic region	Marital Status				
	Total	Never-Married	Currently-Married	Widowed	Divorced/Separated
Entire country	100.0	25.6	66.1	6.6	1.7
Northern Midlands and Mountains	100.0	21.3	71.1	6.3	1.3
Red River Delta	100.0	23.1	68.6	7.0	1.3
North and South Central Coast	100.0	26.2	65.0	7.8	1.0
Central Highlands	100.0	25.6	67.4	5.7	1.3
Southeast	100.0	32.5	59.4	5.5	2.6
Mekong River Delta	100.0	24.6	66.7	6.5	2.2

2.2 Singulate mean age at marriage by residence, region and province

Marriage features of Vietnam population in the period from 1999 to 2010 are presented in Table 2.3, including percentage of ever-married population aged 15-19, 20-24, 45-49 and singulate mean age at marriage (SMAM). Singulate mean age at marriage shows the mean duration (number of years) during which a synthetic cohort of brides and grooms had been single before entering into their first marital union. This indicator is normally calculated separately for males and females.

Percentage of ever-married population in the age group 45-49 shows singleness in relation to human reproduction and the extent of the universality of marriage. This rate of males has been quite stable, standing at 98% over the time. Proportion of ever-married female population in the age group 45-49 stood stably at 92%-94%.

Singulate mean age at marriage is likely to increase for men. In comparison with the 1999 completed census results, SMAM of males increased 0.8 years in 2010, while SMAM of females remained almost unchanged in 2010. In 2010, the difference in SMAM between males and females is likely to increase, to 3.5 years in 2010.

TABLE 2.3: SINGULATE MEAN AGE AT MARRIAGE, PROPORTION OF EVER-MARRIED POPULATION AGED 15-19, 20-24 AND 45-49 BY SEX AND DIFFERENCES IN SMAM, VIETNAM 1999-2010

Census or survey year	Male				Female				Difference in SMAM between male and female	
	SMAM (years)	Proportion ever-married			SMAM (years)	Proportion ever-married				
		15-19	20-24	45-49		15-19	20-24	45-49		
1999	25.4	2.5	30.4	98.5	22.8	9.3	54.3	94.2	2.6	
2000	25.7	1.8	28.0	98.5	22.9	7.2	51.9	93.4	2.8	
2001	25.7	1.9	28.5	98.6	22.8	8.0	52.6	93.4	2.9	
2002	26.0	1.6	24.9	98.2	22.8	7.0	48.3	91.7	3.1	
2003	26.2	1.6	23.4	98.5	23.1	6.6	46.2	93.1	3.1	
2004	26.7	1.4	20.1	98.0	23.4	6.4	42.7	93.4	3.3	
2005	26.8	1.5	19.4	98.2	23.5	6.2	42.1	93.4	3.3	
2006	26.6	1.6	21.1	98.0	23.2	6.1	45.4	93.7	3.4	
2007	26.6	1.7	21.4	98.0	23.3	6.0	44.9	93.7	3.3	
2008	26.6	1.5	22.0	97.9	23.1	6.2	47.2	93.8	3.4	
2009	26.2	2.2	24.4	97.9	22.8	8.5	49.2	94.4	3.4	
2010	26.2	2.2	24.6	97.7	22.7	8.7	49.6	93.9	3.5	

Source:

- 1999-2008: *The 1/4/2008 population change and family planning survey: Major Finding, Table 2.3, Page 41.*
- 2009: *The 2009 Vietnam Population and Housing Census: Major Findings, Table 3.14, Page 48.*

Table 2.4 presents singulate mean age at marriage of males and females by socio-economic regions and urban/rural areas. Singulate mean age at marriage vary from residence to another. For both males and females, SMAM in urban areas is higher than corresponding SMAM in rural areas. In 2010, SMAM of males in urban areas is 2.2 years higher than SMAM of males in rural areas. This differential of females is 2.4 years. This suggests that urban males are likely to marry later than rural males.

Data shows that, SMAM is highest in the Southeast (27.6 years for males and 24.3 years for females), followed by the North and South Central Coast. This SMAM is the lowest in the Northern Midlands and Mountains (24.2 years for males and 21.1 years for females), followed by Central Highlands (25.6 years for males and 21.8 years for females). These two regions have a high proportion of small ethnic groups.

Data also reveal that in the same region the higher SMAM of males is, the higher SMAM of females is. In general, the higher urbanization degree or stronger development is likely to result in later marriage.

TABLE 2.4: SINGULATE MEAN AGE AT MARRIAGE BY SEX,
URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGIONS, 2010

Residence/Socio-economic region	SMAM		Difference in SMAM between male and female	Unit: Years
	Male	Female		
Entire country	26.2	22.7	3.5	
Urban	27.8	24.3	3.5	
Rural	25.6	21.9	3.7	
Socio-economic region				
Northern Midlands and Mountains	24.2	21.1	3.1	
Red River Delta	26.1	22.5	3.6	
North and South Central Coast	26.6	22.7	3.9	
Central Highlands	25.6	21.8	3.8	
Southeast	27.6	24.3	3.3	
Mekong River Delta	26.3	22.6	3.7	

Singulate mean age at marriage of men and women and difference in SMAM between men and women by province/city are presented at the Annex 5. Da Nang has the highest singulate mean age at marriage of men (28.6 years), followed by Ho Chi Minh City (28.5 years) and Thua Thien - Hue (28.3 years). This SMAM is the lowest for Ha Giang (22.3 years), followed by Lai Chau and Son La (22.4 years for both). SMAM of females has the same trend.

Regarding the difference in SMAM between men and women by province, in 1999, there were only 5 provinces whose difference in SMAM was 3.5 years and over but in 2010, this age gap was 4 years and over for 21 provinces. This shows that more and more males get married to females whose ages are much younger than male ages. The gap of SMAM between men and women is highest in Thai Binh (5.4 years), followed by Quang Nam (5.2 years) and Ha Tinh (5 years). The lowest gap belongs to Dien Bien (1.7 years), followed by Binh Duong (1.8 years) and Ha Giang (1.9 years).

2.3. Adolescent marriage

Data from the 1999, 2009 Population and Housing Censuses and annual population change sample surveys showed that marriage at adolescent age is found. In

order to know that trend, Table 2.5 presents percentage of ever-married population aged 15-19 by single year of age and adolescent singulate mean age at marriage.

For men and women, the proportion of adolescent marriage in rural areas is 2.5 times higher than urban areas. Percentage of ever-married females aged 18 is 15.6% in rural areas, which is nearly twice higher at the age of 19 (26.3%). In urban areas, those figures are 3% and 7%, respectively.

TABLE 2.5: PERCENTAGE OF EVER-MARRIED POPULATION AGED 15-19 BY SINGLE YEAR OF AGE, SINGULATE MEAN AGE AT MARRIAGE OF ADOLESCENTS BY SEX, URBAN/RURAL RESIDENCES AND SOCIO-ECONOMIC REGIONS, 2010

Sex/residence/socio-economic region	Percentage ever-married at age						SMAM
	15	16	17	18	19	15-19	
MALE							
Total	0.7	0.7	1.5	2.5	5.8	2.2	19.0
Urban	0.4	0.3	0.5	1.1	2.7	1.0	18.9
Rural	0.8	0.8	1.7	3.0	7.0	2.6	19.0
Socio-economic region							
Northern Midlands and Mountains	2.4	2.3	4.9	7.9	14.2	6.2	18.6
Red River Delta	0.3	0.1	0.5	0.4	2.0	0.7	19.3
North and South Central Coast	0.2	0.6	0.8	1.8	5.4	1.6	19.1
Central Highlands	0.9	0.9	2.2	3.4	7.1	2.6	19.1
Southeast	0.5	0.3	0.7	1.2	3.1	1.2	19.1
Mekong River Delta	0.5	0.5	1.1	2.9	6.2	2.2	19.1
FEMALE							
Total	1.1	2.8	6.4	12.4	21.2	8.7	18.6
Urban	0.5	1.3	3.7	5.2	10.9	4.7	18.6
Rural	1.3	3.3	7.3	15.6	26.3	10.2	18.7
Socio-economic region							
Northern Midlands and Mountains	3.3	5.8	12.5	22.8	39.2	16.0	18.4
Red River Delta	0.1	0.7	2.7	9.1	15.7	5.9	19.0
North and South Central Coast	0.9	2.4	5.3	10.0	17.8	6.5	18.8
Central Highlands	1.4	4.7	8.4	19.3	29.1	11.1	18.5
Southeast	0.4	1.9	4.0	7.2	13.4	6.0	18.6
Mekong River Delta	1.3	3.3	8.6	15.8	26.2	11.1	18.5

There is a substantial differential in proportion of population aged 15-19 by region. Proportion of ever-married population for both of sexes is highest in the Northern Midlands and Mountains, followed by the Central Highlands. In the Northern Midlands and Mountains, nearly 7 out of 50 males aged 19 are ever-married (14.2%), this figure of females is 2.5 times higher (reaching 39.2%). This region has a fairly high proportion of small ethnic groups. Moreover, in these two regions, the industrialization is lower and the economy is not as developed as other regions, which

can be the reason to cause higher adolescent marriage than the remaining regions. The lowest proportion of ever-married of males aged 15-19 belongs to the Red River Delta (under 1%), and that figure of females is 5.9%.

III. EDUCATION

Vietnam has achieved considerable success in education, the elimination of illiteracy has been completed, completes generalization of primary and being implementing generalization of lower-secondary education in the entire country. Vietnam's national education system is quite complete, united and plentiful with full degrees, kinds of schools and education levels from pre-school to post-graduate; secondary school, vocational and professional training network that are widely built all over the nation.

To understand more clearly about the current educational status of Vietnam, questions were introduced to collect information on school attendance for each of the household members aged 5 years and over. Like the 2009 Census, these questionnaire included current and previous school attendance, the highest educational level completed and literacy.

3.1 School attendance

Current school attendance includes those who are attending one of the schools belonging to our national educational system. Data in Table 3.1 shows that nearly one fourth of the population are attending in some school (24.0%). Over the past 20 years, percent of never-attended population aged 5 years and over has decreased considerably. In 2010 there were only 4.8% of population who are never-attended, which was 0.3 percentage points lower than in 2009.

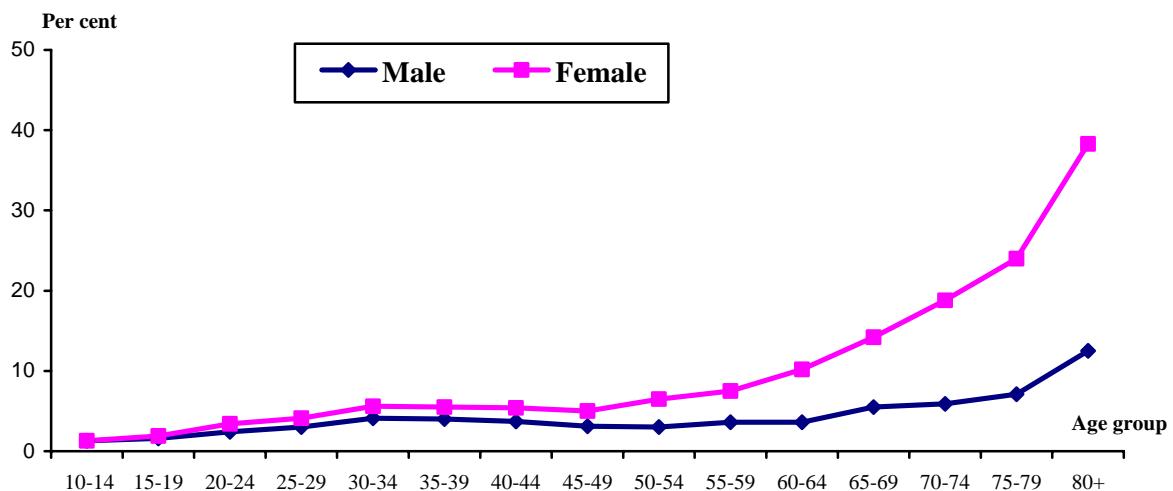

TABLE 3.1: PERCENTAGE DISTRIBUTION OF POPULATION AGED 5 YEARS AND OVER
BY SCHOOL ATTENDANCE, 1989-2010

School attendance	1989	1999	2009	2010	Unit: Percent
Total	100.0	100.0	100.0	100.0	
Currently attending	23.6	27.6	24.7	24.0	
Ever attended	58.4	62.6	70.2	71.2	
Never attended	18.0	9.8	5.1	4.8	

Source: 1989, 1999 and 2009: the Central Population and Housing Census Steering Committee, "The 2009 Vietnam Population and Housing Census: Major Findings", 2010, Table 7.1, page 87".

Figure 3.1 shows that proportion of female never-attended is higher than that of male, in another words, females face more disadvantages in education than males do. However, the fact that the two curves are close at younger age group and more far away from each other at older single years of age indicates that reflects the difference in the proportion of never-attended population by sex was significantly narrowed in the recent years.

Figure 3.1: Percentage of population aged 10 years and over who never-attended school by sex and age group, 2010

Issues described above indicate that school attendance in the past is worse than that of in the recent years, and female school attendance is worse than male's. This confirms two concomitant tendencies of Vietnam education is that the improvement of school attendance and reduction of educational gap by sex.

3.2. Gross and net enrolment rates

According to Vietnam's Education Law, the general education system in Vietnam is divided into three levels, with varying requirements on duration and ages as follows: (1) primary school: from grade 1 to 5, pupils start grade 1 at age 6 years; (2) lower secondary school: from grade 6 to 9, pupils starting grade 6 must have completed primary school and be at least 11 years of age; (3) upper secondary: from grade 10 to 12, pupils starting grade 10 must have completed lower secondary and be at least 15 years of age. Besides general schooling, there is also tertiary education including junior college, university, Masters and PhD programs; in this analysis of enrolment rates, when discussing tertiary education we will only discuss enrolment

rates among junior college and university, using general duration of schooling at this level from 3 to 4 years, and age at the beginning of this education level set at 18 years.

Enrolment rates are indicators that reflect inputs to education. The gross enrolment rate is the number of pupils/students who are enrolled in a given educational level, regardless of their age, as a percentage of the total population of the official age for that educational level. The net enrolment rate is the number of pupils/students of the official age for a given level of schooling who are enrolled in that level as a percentage of the total population of the official age for that educational level.

Table 3.2 presents gross and net enrolment rates by educational level. The data show that in general, the country has achieved universal primary education. Regarding lower secondary education, Vietnam has achieved a gross enrolment rate of 88.8%. In primary school, there is little difference in the enrolment rate between urban and rural areas (101.3% versus 103.5%). However, the higher the educational level, the greater the disparity in enrolment rates between urban and rural areas, specifically: in lower secondary, the urban-rural gap is 5.7 percentage points; in upper secondary the gap is 18.4 percentage points and at junior college and university levels, the gap is 43.3 percentage points.

TABLE 3.2: GROSS AND NET ENROLMENT RATES BY LEVEL OF SCHOOLING, URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 2010

Residence/socio-economic region	Gross enrolment rate				Net enrolment rate				<i>Unit: Percent</i>
	Primary	Lower secondary	Upper secondary	Tertiary	Primary	Lower secondary	Upper secondary	Tertiary	
Entire country	102.9	88.8	65.0	24.8	94.9	81.9	58.1	16.9	
Urban	101.3	93.1	78.8	54.4	96.4	87.8	71.2	37.4	
Rural	103.5	87.4	60.4	11.1	94.4	80.0	53.7	7.5	
Socio-economic region									
Northern Midlands and Mountains	104.0	89.3	59.0	9.9	92.7	78.7	51.1	5.9	
Red River Delta	102.6	96.7	83.1	34.9	97.0	92.2	76.6	25.9	
North and South Central Coast	103.4	91.4	66.8	20.2	96.1	84.6	60.6	13.9	
Central Highlands	104.0	84.3	59.6	11.1	93.6	76.1	51.9	6.2	
Southeast	101.1	90.0	64.8	42.5	95.7	83.5	57.0	28.3	
Mekong River Delta	102.7	77.9	48.6	13.2	93.1	71.4	41.7	8.3	

Data indicate opposite tendencies in educational enrolments in the two major delta areas of the country. While the Mekong River Delta has the lowest gross enrolment rates in lower secondary and upper secondary (respectively 77.9% and 48.6%), the Red River Delta has the highest rates (respectively 96.7% and 83.1%). This indicates that lower and upper secondary enrolments are a major concern for the Mekong River Delta.

3.3 Literacy

Literacy is the ability to read and write a simple passage on everyday activities using the Vietnamese national language, an ethnic minority language or a foreign language. The question on literacy is asked of all people who have not yet completed primary schooling (i.e. not yet completed grade 5), and the assumption is that all people who have education beyond primary school are literate. The literacy rate is one of the most general measures of educational output, and is defined as the percentage of literate people in a given age out of the total population in that age group.

Result of the 1/4/2010 survey shows that literacy rate of population aged 15 years and over is 93.7%. Literacy rates in urban areas are higher than in rural areas due to disparities in level of development between the two areas. Nevertheless, in recent years, because of policies for universal primary education and elimination of illiteracy, the gap in literacy rates between urban and rural areas has fallen quite low - less than 5 percentage points (97.0% in urban areas and 92.3% in rural areas).

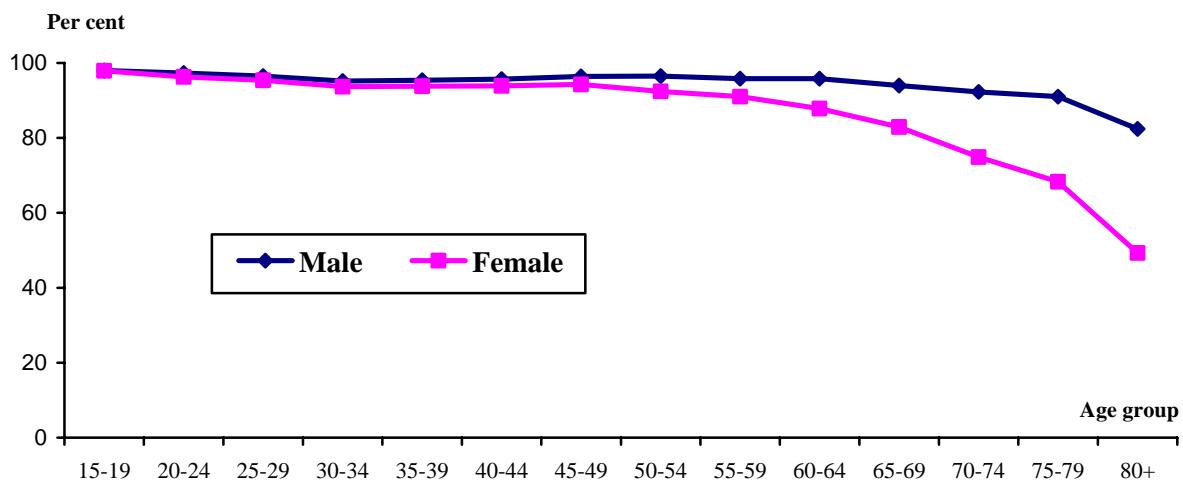

TABLE 3.3: LITERACY RATE OF THE POPULATION AGED 15 YEARS AND OVER BY SEX,
URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 2010

Residence/socio-economic region	Total	Urban	Rural	Urban-rural gap
Entire country	93.7	97.0	92.3	4.8
Urban	95.9	98.1	95.0	3.1
Rural	91.6	96.1	89.6	6.5
Socio-economic region				<i>Unit: Percent</i>
Northern Midlands and Mountains	88.3	97.4	86.5	10.9
Red River Delta	97.3	98.8	96.6	2.2
North and South Central Coast	93.3	96.4	92.3	4.2
Central Highlands	89.9	95.5	87.5	8.0
Southeast	96.3	97.5	94.7	2.8
Mekong River Delta	92.2	94.5	91.6	2.9

The Red River Delta is the region with the highest literacy rates (97.3%). The lowest literacy rates are found in the Northern Midlands and Mountains (88.3%), this is also the region with the largest urban-rural gap in literacy rates at 10.9 percentage points, followed by the Central Highlands with an urban-rural gap of 8 percentage points. In the other regions the urban-rural gap is only about 3 percentage points (Table 3.3).

Figure 3.2 shows the literacy rates of the population 15 years and older by age group. These data indicate that literacy rates in Vietnam have improved substantially in the past few decades. The younger the age group, the higher the literacy rate, and the narrower the male-female gap of literacy rates in the young age groups. The two curves in the figure, referring to male and female literacy rates by age group in younger ages, are very close together, but become further apart in the age groups starting around 50 years and older, indicating that in the past women were more disadvantaged than men in schooling, but that this inequality has been reduced considerably in recent years. The data above reveal that success of the national education is presented not only in the highly increased literate rate, but also in the achieved equality targets.

Figure 3.2: Literacy rates of the population aged 15 years and over by age group and sex, 2010

3.4. Educational attainment

Education is one of the important indicators reflecting the quality of the population. Data in the Table 3.4 show that number of population who graduated upper secondary school or above of the entire country constituted 47.5% of total

population aged 5 years and over. There has been a gap between the educational level of urban areas and that of rural areas. In 2010, the proportion of those who graduated upper secondary schools and above of urban areas is 37.8%, 23.9 percentage points higher than that of rural areas.

TABLE 3.4: PROPORTION OF THE POPULATION AGED 5 YEARS AND OVER BY EDUCATIONAL ATTAINMENT, URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 2010

Unit: Percent

Residence/socio-economic region	Total	Never attended	Incomplete primary	Completed primary	Completed lower secondary	Completed upper secondary and higher
Entire country	100.0	4.8	21.1	26.6	26.4	21.1
Urban	100.0	2.4	16.0	20.9	22.9	37.8
Rural	100.0	5.8	23.3	29.1	27.9	13.9
Socio-economic region						
Northern Midlands and Mountains	100.0	9.4	20.6	24.4	26.9	18.7
Red River Delta	100.0	1.8	14.3	17.1	36.6	30.2
North and South Central Coast	100.0	4.5	20.9	28.4	27.4	18.8
Central Highlands	100.0	7.6	24.2	30.4	23.9	13.9
Southeast	100.0	3.0	18.8	26.8	22.8	28.6
Mekong River Delta	100.0	6.0	30.5	35.8	17.0	10.7

There are considerable regional disparities in educational attainment. The two regions with the highest levels of socio-economic development are also the locations that strongly attract people with high education, namely the Red River Delta and the Southeast. In these two regions, the number of people who have completed upper secondary and higher account for 30.2% and 28.6% of the population of these regions. The Mekong River Delta and the Central Highlands are the two regions with the highest proportion who have never completed primary education (accounting for 30.5% and 24.2% of their populations respectively). These are also the regions with the lowest proportion completing upper secondary and higher, especially the Mekong River Delta (10.7%, only half the national level).

In summary, it can be seen that Vietnam education has gained considerable achievements in the recent years. Proportion of literate population is fairly high, and still increasing. Almost every person is ever attended school. At the time of survey, nearly one forth of population aged 5 years and over is attending school. However, it is necessary to find more appropriate solutions to solve the current problems. First of all, some provinces in the Northern Midlands and Mountains, Central Highlands and Mekong River Delta are facing difficulties in transportation and economic limitation,

hence there is a small part of the population have not accessed fully to the national education. In those places, the indicators of literate rate and school attendance are far lower than the national average. Secondly, there is a differential in educational indicators by residence and sex, even though it has been narrowed over the time. In detail, these educational indicators of rural areas are lower than that of urban areas, and of females are lower than that of males.

IV. FAMILY PLANNING AND REPRODUCTIVE HEALTH

4.1 Implementation of family planning

4.1.1 The Contraceptive Prevalence Rate (CPR)

Questions on family planning are designed and recorded for currently married women aged 15-49 years. Results of the 1/4/2010 population change and family planning survey show that, the contraceptive prevalence rate is 78%, 1.5 percentage points lower than that collected from the 1/4/2008 survey. In the 21st century, results from the annual 1st April population change and family planning sample surveys reveal that, the contraceptive prevalence rate in Vietnam is increasing. In 2003, the contraceptive prevalence rate decreased 1.6 percentage points in comparison with that in 2002 then gradually increased and reached its peak at the time of 1/4/2008 (79.5%).

TABLE 4.1: CONTRACEPTIVE PREVALENCE RATE IN VIETNAM, 1998-2010

Time	Total		Urban areas		Rural areas		<i>Unit: Percent</i>
	Any Method	Modern Method	Any Method	Modern Method	Any Method	Modern Method	
1/4/1998	71.9	57.9	NA	NA	NA	NA	
1/4/2001	73.9	61.1	NA	NA	NA	NA	
1/4/2002	76.8	64.7	76.7	59.3	76.9	66.5	
1/4/2003	75.0	63.3	72.5	56.4	75.8	65.6	
1/4/2004	75.7	64.6	73.5	58.3	76.4	66.9	
1/4/2005	76.9	65.8	74.9	59.7	77.6	67.9	
1/4/2006	78.1	67.2	76.1	61.3	78.8	69.4	
1/4/2007	79.0	68.2	77.3	62.9	79.6	70.1	
1/4/2008	79.5	68.8	76.2	62.1	80.8	71.4	
1/4/2010	78.0	67.5	76.0	63.3	78.8	69.2	

Notation: 'NA' means no data supplied;

Source: 1998-2008: General Statistical Office, "Population Change, Labor Force and Family Planning survey 1/4/2008", June 2009, Table 6.1, Page 111.

The contraceptive prevalence rate of modern method at 1/4/2010 reached 67.5%, 1.3 percentage points lower than that of 1/4/2008 survey result. While the contraceptive prevalence rate of traditional method are still reduced but not many.

The contraceptive prevalence rate of any method in rural areas is 2.8 percentage points higher than that in urban areas. In which, the contraceptive prevalence rate of modern method in rural areas is 5.9 percentage points higher than that in urban areas (69.2% compared to 63.3%), while the contraceptive prevalence rate of tradition method in rural areas is 3.1 percentage points lower than that in urban areas (9.6% compared to 12.7%). This trend kept continued throughout the last century (Annex 7). The data reveal that, in the last decade, family planning programs have been focused on propaganda and efficiently implemented in rural areas, hence the programs have contributed to help decline in fertility rate in rural areas, through which have helped decline in the nation fertility rate over the last 10 years.

The contraceptive prevalence rate of modern method is fairly high in economically difficult areas such as North and South Central Coast (71.0%), Northern Midlands and Mountains (68.7%) and Mekong River Delta (68.3%). These data once again prove that family planning programs were invested and concentrated in implementation over the last 10 years.

TABLE 4.2: CONTRACEPTIVE PREVALENCE RATE BY URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 1/4/2010

Residence/socio-economic region	Contraceptive Prevalence Rate	In which:		<i>Unit: Percent</i>
		Modern Method	Traditional Method	
Entire country	78.0	67.5	10.5	
Urban	76.0	63.3	12.7	
Rural	78.8	69.2	9.6	
Socio-economic region				
Northern Midlands and Mountains	77.5	68.7	8.8	
Red River Delta	78.6	67.6	11.0	
North and South Central Coast	78.9	71.0	8.0	
Central Highlands	79.4	64.6	14.8	
Southeast	73.7	62.1	11.6	
Mekong River Delta	79.8	68.3	11.5	

4.1.2 Implementation of contraceptive methods by age group of women

As shown in Table 4.3, age-patterns of using contraceptive methods from 2004 to 2010 are rather similar. The contraceptive prevalence rate of any method increases

gradually from age group 15-19 and reaches a peak at age group 35-39 (Figure 4.1 and 4.2). Data provide over years reveal that the difference of contraceptive prevalence rates between age groups has been narrowed. Comparing the highest contraceptive prevalence rates in the age group 35-39 to the lowest contraceptive prevalence rate in the age group 15-19, it is found that difference in contraceptive prevalence rate between those age groups decreases. In 2002, contraceptive prevalence rate of any method in the age group 35-39 is 3.9 times higher than that of the age group 15-19, however in 2010, this figure is 2.9 times. Similarly, difference in contraceptive prevalence rates of modern methods between age groups has been also narrowed. This proves that there are more and more currently married women aged 15-49 use contraceptive methods, especially modern ones.

Figure 4.1: Any contraceptive prevalence rate by age, 2002-2010

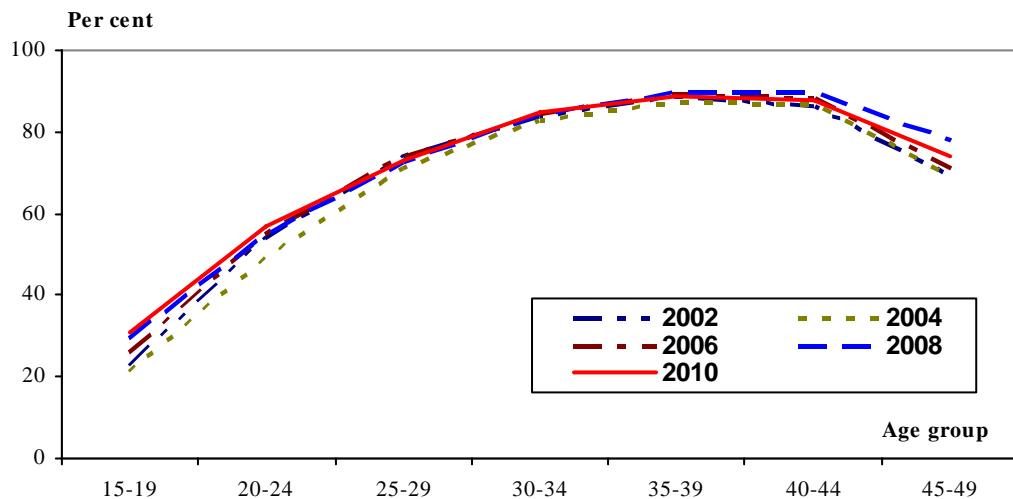

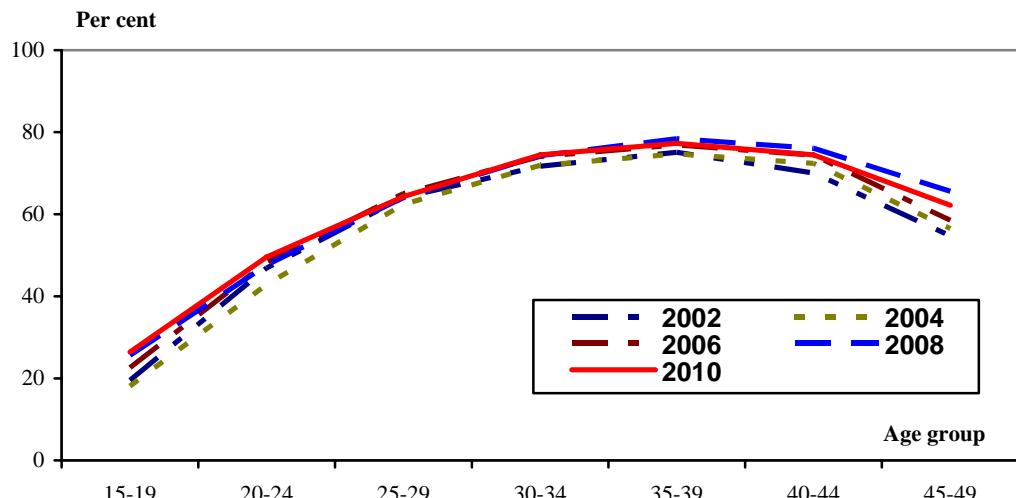

Figure 4.2: Modern contraceptive prevalence rate by age, 2002-2010

4.1.3 Current use of contraception

Table 4.3 indicates that the most popular contraceptive method used in Vietnam is intra-uterine device (IUD). The rate of using IUD has fluctuated from 2002 to 2010 but always maintained at a high level of more than 50%. In 2010, among those who use modern contraceptive methods, IUD use rate is more than 60%. The rate of traditional contraceptive use is 13.1%. The percentage of women who use some methods with higher effectiveness, such as pill and condom, has increased.

TABLE 4.3: PROPORTION OF CURRENTLY MARRIED WOMEN AGED 15-49 YEARS WHO ARE CURRENTLY USING CONTRACEPTION BY METHODS, 2002-2010

Others	0.4	1.4	0.8	0.8	0.7	0.4	0.2	0.3	

Source: Population change and family planning on 1/4/2002, 2003, 2004 and 2005: Major Findings, the Statistics Publishing House, Hanoi 2002, 2003, 2004, 2005.

4.1.4 Number of children surviving and current use of contraception

Figure 4.3 reflects the proportion of women by number of children surviving and current use of contraception. Group of currently married women with none or only one child surviving mainly uses temporary contraceptive methods such as pill, condom or periodic abstinence/withdrawal in order to lengthen birth interval between 2 births or to delay to choose a more suitable time for giving birth. Group of currently married women with more than three children surviving mainly uses permanent contraceptive methods such as IUD, injection or female sterilization.

Figure 4.3: Proportion of women currently using contraception by number of children surviving and current contraceptive use, 2010

Nearly half of those who currently use contraceptive methods have 2 children surviving (49.7%). More than one-fourth of women currently using contraceptive methods have 3 children surviving and over. However, the sterilization rate of those who have 3 children surviving and over is still very high, in which male sterilization is 60.9% and female sterilization is 61.5% as compared to total women using the same method.

TABLE 4.4: PROPORTION OF CURRENTLY MARRIED WOMEN AGED 15-49 YEARS WHO ARE CURRENTLY USING CONTRACEPTION BY CONTRACEPTIVE METHODS AND NUMBER OF CHILDREN SURVIVING, 2010

Unit: Percent

Contraceptive methods	Total	Number of children			
		None	1 child	2 children	3 children

4.1.5 Reasons of non-use of contraceptive methods

In the data collected from the 1/4/2010 population change and family planning survey, among women who currently do not use contraceptive methods, reasons of “want (more) children” account for 42.9%, “pregnant” is 12.9% (2.1 percentage points decreased as compared to 2008). Among other reasons (44.2%), non-use of contraception because of “menopause” occupies a rather high proportion (18.1%), especially to elder women. Unawareness or being opposed by husbands occupies a small proportion, with 1.5% and 1.1% respectively.

TABLE 4.5: RATE OF CONTRACEPTIVE NON-USE BY MAIN THREE REASONS, 2001-2010

Unit: Percent

	2001	2002	2004	2005	2006	2007	2008	2010
Total	100.0							
Pregnant	12.4	12.8	11.0	11.8	13.6	14.2	15.0	12.9
Want more children	35.9	36.7	38.4	39.2	38.4	42.3	42.0	42.9
Others	51.7	50.5	50.7	49.0	48.0	43.5	43.0	44.2

As shown in Table 4.6, the rate of contraceptive non-use of urban areas is 2.8 percentage points higher than that of rural areas (24% compared to 21.2%). The rate of contraceptive non-use due to “want (more) children” and “difficulty becoming pregnant/menopausal” differs from urban areas to rural areas. For other reasons such as “pregnant”, “unawareness”, “others opposed”... there is almost no difference between urban areas and rural areas in terms of contraceptive non-use rate.

Study on the relationship of contraceptive non-use rate according to the reasons of contraceptive non-use and women’s age groups, we find opposite two trends. The younger the women are, the higher the rate of contraceptive non-use according to the reasons of “pregnant” and “want (more) children” is. On the contrary, for the reasons of “difficulty becoming pregnant/ menopausal”, “weak health”, the rate of contraceptive non-use is low at the young age group and increases gradually with age.

The relationship of contraceptive non-use rate according to the reasons of contraceptive non-use and number of children surviving is also similar to the relationship of contraceptive non-use according to the reasons of contraceptive non-use and women’s age groups. Contraceptive non-use rate decreases gradually with number of children surviving for the reasons of “pregnant” and “want (more)

children”. In contrast, this rate increases with number of children surviving for other reasons such as “difficulty becoming pregnant/ menopausal”, “weak health”.

TABLE 4.6: RATE OF CONTRACEPTIVE NON-USE BY REASONS, URBAN/RURAL RESIDENCE, AGE GROUP AND NUMBER OF CHILDREN SURVIVING, 2010

Unit: Percent

Characteristics	By reasons for contraceptive non-use									
	Total	Pregnant	Want children	Unawareness	Others opposed	High price	Weak health	Difficulty becoming pregnant/ menopausal	Others	Not determined

4 children	14.9	0.4	0.9	0.8	0.3	0.0	2.4	8.2	1.8	0.0
5 children and over	20.8	0.4	0.8	1.7	0.8	0.1	2.9	12.3	1.8	0.1

4.2 Reproductive health care

4.2.1 Induced abortion and menstrual regulation

Beside contraceptive methods, childbearing would be regulated by induced abortion and menstrual regulation. In Vietnam, abortion and menstrual regulation can be conducted both at public and private facilities. Information on abortion and menstrual regulation has been collected only for currently married women aged 15-49 years.

According to data in Table 4.7, there is an insignificant difference in the rate of currently married women aged 15-49 years who have had abortion or menstrual regulation in 12 months preceding the survey time-point by urban and rural areas. This rate has slightly declined in the recent years. In 2010, it declines 0.2% from the level of 2008. The decline in rural areas is a little bit slower than that of urban areas.

TABLE 4.7: RATE OF ABORTION AND MENSTRUAL REGULATION
BY URBAN/RURAL RESIDENCE, 1998-2010

Year	Entire country	Urban	Rural	<i>Unit: Percent</i>
1998	1.5	1.9	1.4	
2001	1.3	1.7	1.2	
2002	1.1	1.1	1.1	
2003	1.7	1.9	1.7	
2004	1.2	1.3	1.2	
2005	1.0	1.0	1.0	
2006	1.1	1.4	0.9	
2007	0.7	0.6	0.8	
2008	1.0	1.1	0.9	
2010	0.8	0.8	0.8	

In data collected from the 1/4/2010 population change and family planning survey, Northern Midlands and Mountains is the region that has the highest rate of abortion and menstrual regulation (1.2%), followed by Red River Delta (1.1%). The figures of the remaining regions are about the same value (0.5-0.7%).

TABLE 4.8: RATE OF ABORTION AND MENSTRUAL REGULATION
BY URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 2007-2010

Residence/socio-economic region	2007	2008	2010	<i>Unit: Percent</i>
Entire country	0.7	1.0	0.79	
Urban	0.6	1.1	0.82	
Rural	0.8	0.9	0.78	
Socio-economic region				
Northern Midlands and Mountains	1.4	1.5	1.25	
Red River Delta	1.3	1.9	1.11	
North and South Central Coast	0.3	0.4	0.51	
Central Highlands	0.1	0.3	0.50	
Southeast	0.4	0.8	0.53	
Mekong River Delta	0.4	0.5	0.71	

In general, Northern Midlands and Mountains and Red River Delta are the regions that always have a higher rate of abortion and menstrual regulation than the remaining regions. Central Highlands, North and South Central Coast are two regions that the rate of abortion and menstrual regulation is always at the lowest level.

Study on the rate of abortion and menstrual regulation by sex and number of children surviving shows that, in urban areas this rate of women who have 2 sons is higher than that of women who have 2 daughters (with 1.01% and 0.83% respectively), while there seems to be an opposite trend in rural areas: the rate of abortion and menstrual regulation of women having 2 daughters is higher than those having 2 sons (with 0.79% and 1.12% respectively). It appears that there is a sex selection of the third birth order in regards to women having 2 children with the same sex.

TABLE 4.9: RATE OF ABORTION AND MENSTRUAL REGULATION BY SEX AND NUMBER OF CHILDREN SURVIVING, URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 2010
Unit: Percent

Residence/socio-economic region	0 child	1 son	1 daughter	2 sons	2 daughters	3 sons	3 daughters	Others
Entire country	0.41	0.92	0.81	0.85	1.07	0.43	0.63	0.77
Urban	0.27	1.01	0.83	1.01	0.98	0.48	0.52	0.77
Rural	0.49	0.87	0.79	0.79	1.12	0.42	0.67	0.77
Socio-economic region								
Northern Midlands and Mountains	0.66	1.69	1.13	1.26	2.05	0.77	1.17	1.12
Red River Delta	0.23	1.45	1.19	1.24	1.66	0.07	0.76	1.03
North and South Central Coast	0.31	0.49	0.40	0.45	0.57	0.15	0.58	0.57
Central Highlands	0.26	0.35	0.91	0.27	0.31	0.77	0.34	0.56
Southeast	0.25	0.62	0.41	0.84	0.49	0.41	0.15	0.55
Mekong River Delta	0.69	0.70	0.93	0.55	0.85	0.76	0.65	0.66

Rate of abortion and menstrual regulation of women having 2 daughters surviving in the Northern Midlands and Mountains is particularly high, as twice as the nation average level (2.05% compared to 1.07%).

4.2.2 Status of pregnant women care

For woman who is pregnant, there is nothing more important than taking care for herself and her fetus. All pregnant women in their expecting period need periodical and regular pregnancy check-up. In 2010, rate of at least one pregnancy

check-up for the last birth is 92.6%. This rate in rural areas is 7.5 percentage points lower than that of urban areas.

Due to different abilities in accessing pregnancy tests in different socio-economic regions, rate of at least one pregnancy check-up for the last birth varies greatly among regions, the difference between the highest rate in the Southeast and the lowest rate in the Northern Midlands and Mountains is 19.3 percentage points.

Table 4.10 shows that, compared to 2006, rate of at least one pregnancy check-up for the last birth of the whole country has increased 3.5 percentage points. In which, that rate of rural areas increased more quickly than that of urban areas (3.8 percentage points compared to 1.8 percentage points) although this rate of urban area is higher than that of rural areas. From 2006 to 2010, increase level of rate of at least one pregnancy check-up varies greatly among socio-economic regions. The Central Highlands is the region that has the highest rate (19.7 percentage points).

TABLE 4.10: RATE OF PREGNANCY TEST OF THE LAST BIRTH BY NUMBER OF PREGNANCY TESTS, URBAN/RURAL RESIDENCE AND SOCIO-ECONOMIC REGION, 2006 AND 2010

Unit: Percent

Residence/socio-economic region	1/4/2006		1/4/2010		Increase level from 2006-2010	
	1 time and over	3 times and over	1 time and over	3 times and over	1 time and over	3 times and over
Entire country	89.1	60.3	92.6	74.1	3.5	13.8
Urban	96.1	78.4	97.9	88.1	1.8	9.7
Rural	86.6	53.8	90.4	68.5	3.8	14.7
Socio-economic region						
Northern Midlands and Mountains	73.9	40.8	78.7	54.6	4.8	13.8
Red River Delta	92.3	63.8	97.7	81.5	5.4	17.7
North and South Central Coast	89.8	56.0	90.3	66.9	0.5	10.9
Central Highlands	78.2	37.6	87.9	58.2	9.7	20.6
Southeast	96.6	84.6	98.0	90.2	1.4	5.6
Mekong River Delta	93.8	65.4	97.2	81.1	3.4	15.7

Study on pregnancy test rate of 3 times and over for the last birth also reveals a similar trend with that test rate of 1 time and over. However, the difference in the rate of 3 times and over pregnancy test varies quite significantly from urban areas to rural areas and among socio-economic regions. This difference between urban areas and rural areas is 19.6 percentage points (while the similar test rate of one time and over is 7.5 percentage points). The difference between the highest rate in the Southeast and the lowest rate in Northern Midlands and Mountain areas is 35.6 percentage points.

From 2006 to 2010, pregnancy test rate of 3 times and over has increased quite greatly both in urban and rural areas as well as socio-economic regions; the increase is especially high in economically difficult regions where people have a limited access to public health care such as: rural areas increase by 14.7 percentage points, Central Highlands increases by 20.6 percentage points, Red River Delta increases by 17.7 percentage points and Mekong River Delta increases by 15.7 percentage points (Table 4.10).

V. FERTILITY

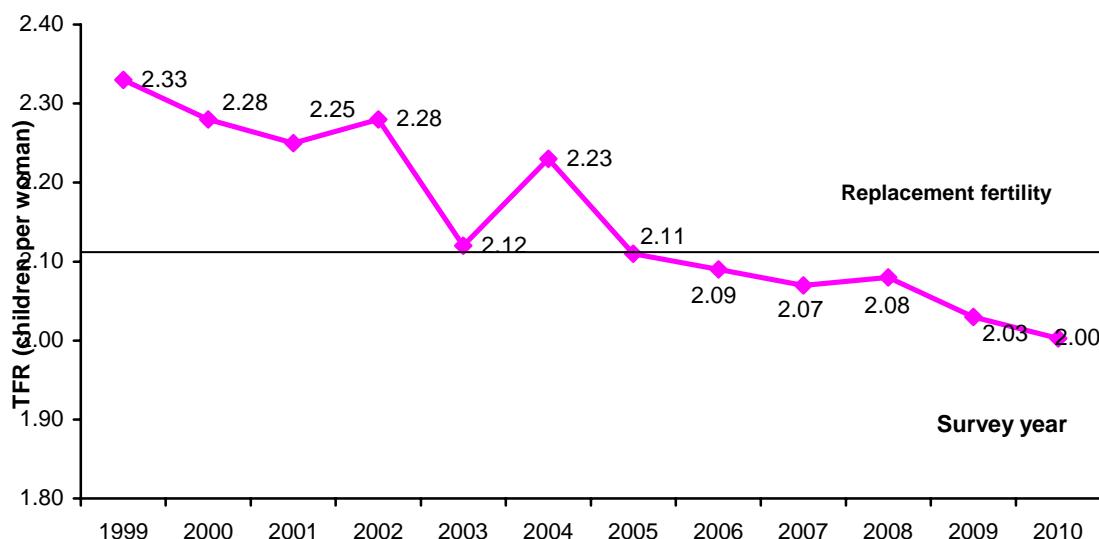

Fertility is a key indicator reflecting population growth and it is also an important tool for launching and implementing the policy of population and family planning. Indicators related to fertility always attract the attention of policy makers, managers and researchers. In Vietnam, because vital registration is still incomplete, indicators reflecting fertility are calculated using survey data. The questionnaire of the 01/4/2010 population change survey collected information of women aged 15 to 49 including: number of children ever born, number of children surviving, number of children deceased, month and year of the last birth, number of male and female children from the last birth. This chapter examines the level and trend in fertility based on fertility's information of women aged 15-49 years, and births which occurred in household during the 12 months prior to the survey point-time. Collected data on births occurring in the last 12 months prior to the survey are subject to various kinds of errors, leading to the under-estimation of fertility. In order to overcome this problem, the indirect estimation has been used.

5.1 Total fertility rate

The total fertility rate (TFR) can be understood as the average number of children that would be born to a woman over her lifetime if in her entire reproductive period she experienced the current age-specific fertility rates as observed in the reference period, usually as the 12 months prior to the survey. TFR is one of the main indicators used to measure fertility. TFR is usually estimated indirectly using the Trussell P/F ratio technique with the assumption that the number of children born in the period 12 months prior to the survey among women aged 15 to 49 years is under-reported. This underreporting usually occurs for cases in which the infant dies or does not stay with the parents.

Figure 5.1 describes changes in TFR estimated for Vietnam over the period 1999-2010. TFR dropped rapidly from 2.33 children per woman in 1999 to 2.03 children per woman in 2009, and reached 2.00 children per woman in 2010. TFR in 2004 (fertility during the period 01 April, 2003 to 31 March, 2004) was slightly higher than in 2003 (fertility during the period 1 April, 2002 to 31 March, 2003), which may be due to a preference for having babies in auspicious years (2003 was the Lunar year of the Goat), yet it fell strongly in 2005 (reached the replacement fertility level with TFR = 2.11 children per woman), and has maintained the continuous downward trend for each year from 2006 to 2010 (under the replacement fertility level)¹. The rapid fall in TFR contributed importantly to reducing population growth over the past 11 years, and is clear evidence of the success in Vietnam's population and family planning program.

Figure 5.1: Total Fertility Rate in Vietnam, 1999 - 2010

Fertility level of Vietnam is lower than average fertility level of the countries in Southeast Asia (TFR of Southeast Asia is 2.4 children per woman). TFR of Vietnam is only higher than that of Brunei (1.7 children per woman), Singapore (1.2 children per woman) and Thailand (1.8 children per woman), but much lower than that of remaining countries in the region.

¹ “Replacement fertility” is the fertility level for which an average cohort of women has just enough daughters to “replace” themselves in population reproduction.

TABLE 5.1: TOTAL FERTILITY RATE OF SOUTHEAST ASIA, 2010

Unit: Children per woman

Country	TFR
Southeast Asia	2.4
Brunei	1.7
Cambodia	3.3
Indonesia	2.4
Laos PDR	3.5
Malaysia	2.6

Country	TFR
Myanmar	2.4
Philippines	3.2
Singapore	1.2
Thailand	1.8
Timor Leste	5.7
Vietnam	2.0

Source: The 2010 World Population Datasheet on the website: <http://www.prb.org>.

Table 5.2 presents the TFR for Vietnam by urban and rural residence for 2005 to 2010. The data of the table indicate that TFR in urban areas in 2010 was 1.77 children per woman, lower than the figure for rural areas at 2.11 children per woman. This differential may be due to more favourable conditions in urban areas compared to rural areas allowing easier access to information, better awareness of the benefits of a small family, and easier access to medical facilities that provide family planning services to help prevent unwanted pregnancies and births. Another reason is that living conditions in urban areas are much better than in rural areas, children in urban areas tend to be better cared for than in rural areas, leading to lower infant and child mortality rates in urban than in rural areas, thus contributing to reducing the need to have more births to replace the children who don't survive.

TABLE 5.2: TOTAL FERTILITY RATE, 2005-2010

Unit: Children per woman

Year	TFR (Children per woman)		
	Entire country	Urban	Rural
2005	2.11	1.73	2.28
2006	2.09	1.72	2.25
2007	2.07	1.70	2.22
2008	2.08	1.83	2.22
2009	2.03	1.81	2.14
2010	2.00	1.77	2.11

Data in Table 5.2 also indicates that TFR in rural areas has fallen relatively rapidly from 2.28 children per woman in 2005 to 2.11 children per woman in 2010, nearly reaching replacement fertility; while in urban areas there has been negligible change, maintaining TFR at 1.80 children per woman from 2005 to 2010. This shows that there have been many positive changes in awareness of the benefits of having fewer children among rural women in the past time.

TABLE 5.3: TOTAL FERTILITY RATE (TFR) BY SOCIO-ECONOMIC REGION, 2005-2010

Unit: Children per woman

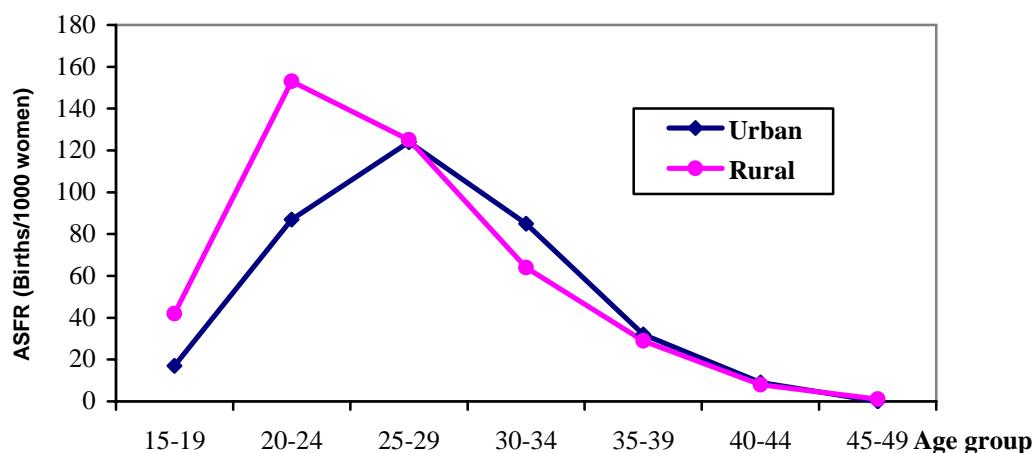

Year	Socio-economic region							
	North east	North west	Red River Delta	North Central	Central Coast	Central Highlands	South east	Mekong River Delta
2005	2.18	2.39	2.11	2.32	2.19	2.77	1.74	1.87
2006	3.07	3.07	2.35	2.70	2.49	3.56	2.16	2.21
2007	2.27	2.27	2.14	2.55	2.40	3.15	2.03	1.99
2008		2.30	2.13		2.30	2.68	1.73	1.87
2009		2.24	2.11		2.21	2.65	1.69	1.84
2010		2.22	2.04		2.21	2.63	1.68	1.80

Table 5.3 presents TFR for the period 2005-2010 disaggregated by socio-economic region. The Central Highlands has remained the region with the highest fertility, followed by Northern Midlands and Mountains. The two regions with the lowest fertility are the Southeast and the Mekong River Delta. In recent years, fertility level of these two regions was lower than the replacement level.

5.2 Age-specific fertility rates

Age-specific fertility rates (ASFR) indicate the number of births for every 1000 women in a given age (or age group) in a reference period, usually for 12 months prior to the survey time-point. Figure 5.2 describes the age specific fertility rates in Vietnam in 2010 by urban/rural residence. Although both curves have a similar “bell shape”, the line representing urban fertility patterns is not only lower, but also indicates a “longer delay” compared to the line representing rural fertility, which means that urban women give birth later and have fewer children than rural women. In urban areas, fertility is highest among women aged 25-29 with 124 children per 1000 women. In rural areas, on the other hand, fertility is highest in the age group 20-24 years with 153 children per 1000 women. If we compare fertility of women in the age group 20–24 years by residence, we find that rural fertility is almost double urban fertility (153 compared to 87). This may result from rural women having few opportunities to obtain higher qualifications compared to urban women, so they tend to marry and give birth earlier.

Figure 5.2: Age-specific fertility rates in urban and rural residence, 2010

5.3 Crude Birth Rate

The most common fertility indicator used in practice is the Crude Birth Rate (CBR). It is usually used to calculate a natural increase rate of population. CBR is defined as the average number of births per 1000 population in a reference period, usually for 12 months prior to the survey time-point. Similar to the TFR, because of under-reporting in the number of births, the CBR is calculated indirectly by taking the crude birth rates directly from the survey and multiplying by the Trussell P/F ratio adjustment factor.

Table 5.4 presents the CBR for Vietnam from 2005 to 2010 by urban and rural residence. The CBR for Vietnam in 2010 was 17.1 births per thousand population of which that of urban area was 16.4 births per thousand persons which was lower than in rural area (17.4 births per thousand population). Like TFR, in this period, the common trend of CBR is a gradual reduction. CBR in the 12 months prior to the 1st April 2010 decreased by 0.5 births per thousand population as compared to the same period prior to the 1st April 2009 Census.

TABLE 5.4: CRUDE BIRTH RATE BY URBAN/RURAL RESIDENCE, 2005-2010

Unit: Births per 1000 population

Year	Entire country	Urban	Rural
2005	18.6	15.6	19.9
2006	17.4	15.3	18.2
2007	16.9	NA	NA
2008	16.7	15.8	17.3
2009	17.6	17.3	17.8
2010	17.1	16.4	17.4

Table 5.5 presents CBR for the period 2005-2010 disaggregated by socio-economic region. There are considerable differences in fertility among socio-economic regions. Similar to TFR, CBR is usually the highest in the Central Highlands and has the lowest value in the Mekong River Delta. The 1st April 2010 population change survey result indicates that, CBR for 12 months prior to the 1st April, 2010 of the Central Highlands was 21 births per thousand population, which are 6 births per thousand population higher than that of the Mekong River Delta. The North and South Central Coast and Mekong River Delta have been the regions with low fertility.

TABLE 5.5: CRUDE BIRTH RATE BY SOCIO-ECONOMIC REGION, 2005-2010

Year	Socio-economic region								<i>Unit: Births per thousand population</i>
	North east	North west	Red River Delta	North Central	Central Coast	Central Highlands	South east	Mekong River Delta	
2005	19.2	22.5	17.2	19.6	18.4	23.9	17,3	18,1	
2006	18.4	21.4	15.9	17.3	18.0	21.9	16,4	16,7	
2007	17.8	21.5	16.2	15.7	17.3	21.5	16,3	16,3	
2008		19.1		16.1		16.3		15.9	
2009		19.6		17.6		16.9		16.0	
2010		19.3		16.7		16.9		15.2	

5.4 Provincial differentials of fertility

All 63 provinces of the country might be divided to 4 groups with various levels of fertility, such as under the replacement level (TFR is under 2.0 children per woman), around the replacement level (TFR is from 2.0 to under 2.2 children per woman), higher than the replacement level (TFR is from 2.2 to under 2.5 children per woman), and high fertility (TFR is equal to or higher than 2.5 children per woman) – look at the Annex 8.

The first group comprises 28 provinces, including some province in the Southeast and the Mekong River Delta: Ho Chi Minh City (1.5), Binh Duong (1.7), Long An (1.9), Tien Giang (1.9), Bac Lieu (1.6), Ca Mau (1.6) ... 12 provinces in Mekong River Delta have TFR belonging to this group.

15 provinces belong to the second group, meaning fertility level close to the fertility replacement level, including some provinces in the Red River Delta and North

and South Central Coast. They are Ha Noi (2.0), Thai Binh (2.1), Phu Tho (2.1), Da Nang (2.2), Phu Yen (2.0),...

The third group comprises 10 provinces, including some provinces in North and South Central Coast and Southeast: Quang Nam (2.3), Binh Phuoc (2.4), Dak Lak (2.5)...

There are 10 provinces in the fourth group. They are mainly located in the Central Highlands (3 provinces). There are provinces with very high fertility in this group such as Dak Nong (2.7), Gia Lai (2.9), Kon Tum (3.5). Remaining six provinces of this group are mainly in the Northern Midlands and Mountains, except for Quang Tri (2.8).

5.5 Proportion of women having third and higher order births

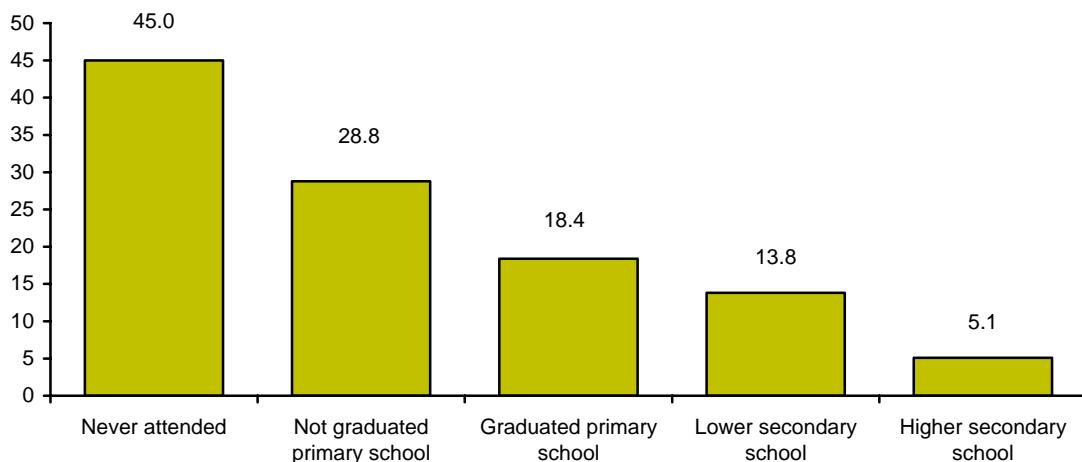

Table 5.6 presents the proportion of women aged 15-49 years having third and higher order births in Vietnam from 2005 to 2010 by urban and rural residence. Data show that in the past, the proportion of women having third or higher order births overall has fallen from 20.8% in 2005 to 15.1% in 2010. Passing through half a decade, the proportion of women having third or higher order births in rural areas has remained double the proportion in urban areas despite more rapid fertility reductions in rural than urban areas. In other words, the proportion of women who stop giving birth after their first or second child in both urban and rural areas has increased, contributing positively to fertility reduction in Vietnam, and achievement of replacement level fertility. This trend has helped Vietnam have the opportunity to achieve a stable population, reducing the child dependency burden, and creating advantages for Vietnam in implementing goals of sustainable and quality economic development.

TABLE 5.6: PROPORTION OF WOMEN AGED 15-49 YEARS WHO HAVE A THIRD OR HIGHER ORDER BIRTH BY URBAN/RURAL RESIDENCE, 2005-2010

Residence	2005	2006	2007	2008	2009	2010	<i>Unit: Percent</i>
Entire country	20.8	18.5	16.7	16.9	16.1	15.1	
Urban	11.6	10.0	9.0	9.7	9.3	9.5	
Rural	23.7	21.4	19.3	19.6	18.9	17.1	

Annual percentage of women giving birth to three children or more depends much on the education of women. That annual percentage of women who have never-attended school is 45.0%, gradually decreasing to 28.8% among women who haven't graduated primary school, 18.4% among women who have graduated primary school, 13.8% among women who have graduated lower secondary school and only 5.1% among women whose educational attainment is upper secondary school and above (see Figure 5.3).

Figure 5.3: Percentage of women aged 15-49 have given the birth to 3 children or more by education level, 2010

Data table indicate that, the proportion of women aged 15-49 having third and higher order births is the highest in the Central Highlands (29%), followed by North and South Central Coast (18%). The Southeast is the region with the lowest rate of women aged 15-49 having third and higher order births (11%). The Central Highlands is also a region with a high concentration of ethnic minority people, approach of contraceptives and communication means on family planning is a bit limited. Therefore, this may be one of causes leading to that the proportion of women aged 15-49 having third and higher order births of this region is the highest among the entire country.

TABLE 5.7: PROPORTION OF WOMEN AGED 15-49 YEARS WHO HAVE A THIRD OR HIGHER ORDER BIRTH BY SOCIO-ECONOMIC REGION, 2010

Residence/socio-economic region	<i>Unit: Percent</i>
Entire country	15.1
Urban	9.5
Rural	17.1
Socio-economic region	
Northern Midlands and Mountains	15.9
Red River Delta	13.1
North and South Central Coast	18.0
Central Highlands	29.0
Southeast	11.1
Mekong River Delta	11.4

5.6 Sex ratio at birth

The sex ratio at birth is determined as the number of boys born per 100 girls born in a given period, usually one calendar year. This ratio is usually about 103 to 107 boys per 100 girls and in general it is quite stable over time and location. Any substantial change in this ratio away from normal biological levels reflects some level of active intervention, and will affect the natural balance, threatening stability of global population. Policy-makers and the media agencies pay much attention to sex ratio at birth. They express their concern about a possibility of increasing sex ratio at birth – that means number of boys is unnaturally higher than that of girls among the newborn babies.

TABLE 5.8: SEX RATIO AT BIRTH, 1999-2010

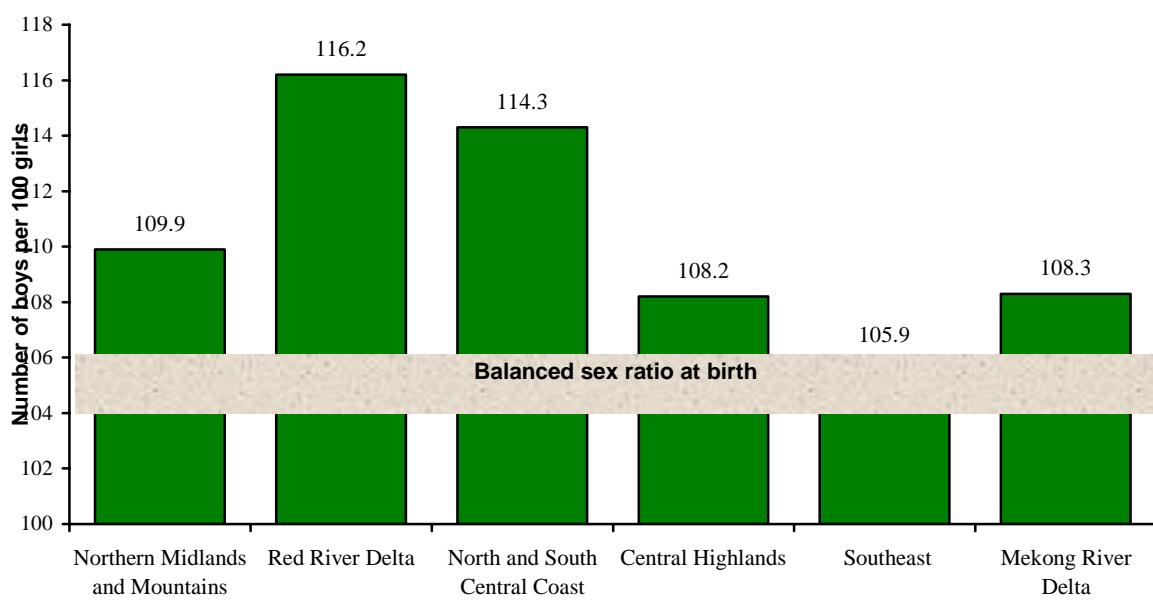

Year	Sex ratio at birth	<i>Unit: Boys per 100 girls</i>
1999	107.0	
2001	109.0	
2002	107.0	
2003	104.0	
2004	108.0	
2005	106.0	
		Year
		Sex ratio at birth
		2006
		109.8
		2007
		111.6
		2008
		112.1
		2009
		110.5
		2010
		111.2

Table 5.8 presents the sex ratio at birth in Vietnam from 1999 to 2010. For the period from 1999 to 2005, data in the table indicate no apparent trend in the Vietnam's sex ratio at birth and the ratio varied between 104 and 109 boys for every 100 girls born. However, starting in 2006 and up to the present, the sex ratio at birth

in Vietnam began to show signs of substantial increase. In 2010, the sex ratio at birth remained at a quite high level of 111 boys for every 100 girls. Clearly there is cause for concern about loss of balance in Vietnam's sex ratio at birth. Therefore, the communication education campaigns affirm and raise status of women in the family and society, eliminate the attitude of "respect men and disdain women", opposes the family violence and monitoring execution of the law on prohibition of determination and selection of fetus sex is one of the important missions in order to contribute to balance in the sex ratio at birth.

Figure 5.4 describes the sex ratio at birth in Vietnam for 2010 by socio-economic region. There are very large differentials in sex ratio at birth among regions in Vietnam in 2010. The region with the lowest sex ratio at birth at 106 boys per 100 girls is the Southeast. The region with the highest sex ratio at birth is the Red River Delta (116 boys per 100 girls). This is also a region with relatively low fertility and a dynamic and developed economy. Here, access to medical services and modern equipment is relatively easy, and the people in this region also have higher levels of education and higher living standards, so they are able and willing to pay for early foetal sex determination services.

Figure 5.4: Sex ratio at birth by socio-economic region, 2010

5.7 Knowing the sex of the fetus before delivery

The questionnaire of the 2010 population change survey comprises questions on women aged 15-49 who gave the last live birth from April 2008 to March 2010. In which, information on status of knowing the sex of the fetus before delivery, knowing the sex as how many weeks of pregnancy and how knowing the sex of the fetus was also collected.

TABLE 5.9: PERCENTAGE RATE OF WOMEN AGED 15-49 WHO HAVE GIVEN THE BIRTH FROM APRIL 2008 TO MARCH 2010 AND KNOW THE SEX OF THE FETUS

Age group/Education level	Total	Urban	Rural
Total	75.2	84.5	71.5
<i>Age group</i>			
15-19	61.2	79.1	58.3
20-24	72.4	84.4	69.4
25-29	77.8	85.4	74.2
30-34	78.5	84.7	74.7
35-39	77.0	82.9	73.8
40-44	73.1	83.3	68.9
45-49	71.6	88.4	65.7
<i>Education level</i>			
Never attended school	30.1	63.2	27.7
Some primary	66.0	79.0	63.7
Primary	77.1	85.3	75.1
Lower-secondary	76.7	84.1	74.7
Short-term training	80.4	82.8	79.0
Higher-secondary	81.3	85.2	78.8
Trade vocational school	84.9	83.3	85.9
Vocational school	82.8	86.3	80.1
Trade college	80.9	94.4	66.9
College	83.4	86.3	80.7
University and over	85.3	85.3	85.0

Table 5.9 shows the percentage rate of women aged 15-49 who gave the birth from April 2008 to March 2010 and knowing the sex of the fetus by some basic characteristics of women. The rate of urban women knew the sex of the fetus before

delivery is 13 percent points higher than that of rural women (85% versus 72%). This rate is gradually increased from age group 15-19, reaches a peak of age group 30-34 and reduces to the end age group 45-49. Similar trend is for urban and rural areas. The proportion of women aware of the sex of their child is at its lowest among those with no or minimal education. Specifically, the proportion of women never attended school aware of the sex of fetus is 30% whereas 85% of women graduated the university and over knew the sex before delivery. Normally, women not aware of the sex of the fetus are persons want more children and do not use contraceptives.

Data in Table 5.10 indicate that majority of the mother know the sex before delivery as fetus is from 15 to 28 weeks (83%). Number of mothers knows the sex before delivery as fetus is 28 weeks and over has the lowest rate (more than 5%). That illustrates that when pregnancy, most of the women want to know early the sex of fetus, especially in the first stage of pregnancy (rate of women knowing the sex as the fetus is under 15 weeks reaches nearly 12%).

TABLE 5.10: PERCENTAGE DISTRIBUTION OF WOMEN AGED 15-49 WHO HAVE GIVEN THE BIRTH FROM APRIL 2008 TO MARCH 2010 BY NUMBER OF WEEKS AS KNOWING THE SEX OF FETUS

Residence/socio-economic region	Under 15 weeks	From 15 to 28 weeks	More than 28 weeks
Entire country	11.6	83.0	5.4
Urban	11.0	85.2	3.8
Rural	11.9	82.0	6.2
Socio-economic region			
Northern Midlands and Mountains	15.1	79.6	5.3
Red River Delta	24.0	72.2	3.8
North and South Central Coast	10.8	81.3	7.8
Central Highlands	10.8	85.3	3.9
Southeast	5.7	89.9	4.4
Mekong River Delta	2.0	91.7	6.3

In entire country, urban/rural residence and 6 socio-economic regions, the rate of women aged 15-49 gave the birth from April 2008 to March 2010 and know the sex of fetus by the ultrasound reaches 99%. This indicates that the ultrasound is a common method to diagnose the sex of fetus. Methods of feeling the pulse, guessing and other occupy very low rates.

TABLE 5.11: PERCENTAGE DISTRIBUTION OF WOMEN AGED 15-49 WHO HAVE GIVEN THE BIRTH FROM APRIL 2008 TO MARCH 2010 BY METHOD OF KNOWING THE SEX OF FETUS

Residence/socio-economic region	Ultrasound	Feel the pulse	Guess	Other
Entire country	99.1	0.3	0.5	0.1

Red River Delta	99.5	0.3	0.2	0.1
North and South Central Coast	98.6	0.2	1.0	0.2
Central Highlands	98.5	0.4	1.0	0.1
Southeast	99.2	0.3	0.3	0.3
Mekong River Delta	99.5	0.2	0.2	0.1

VI. MORTALITY

Mortality has always been an important topic of research in demography and many other scientific fields related to epidemiology, public health or statistics, etc. The purpose of this research has been to gather scientific knowledge needed to improve lives through appropriate programmes and policies. In demographic research, mortality plays a rather important role, and mortality along with fertility are the two most important factors that determine population growth.

The 2010 Population Change Sample Survey provides data for assessing mortality in Vietnam. Two important measures of mortality, the crude death rate (CDR) and infant mortality rate (IMR) were used to assess mortality. Mortality data collected in the questionnaire of the 2010 Population Change Sample Survey, especially the set of questions on deaths in the household in 12 months prior to the survey, face problems of missing deaths. This problem leads to underestimation of mortality, therefore making it necessary to apply indirect estimation methods used worldwide to adjust. The following data were used from the 2010 Population Change Sample Survey to estimate mortality in the 12 months prior to the time-point survey:

- Current age and sex distribution of the population.
- Age and sex distribution of the deaths.

- Number of women, number of children ever born and number of children surviving of women aged 15-49 by 5-year age group.

6.1 Crude death rates

The Brass Growth Balance Method (BGBM) method was used to assess and adjust data on reported deaths. The basic logic of this method is assessment of completeness in death reporting by comparing the age structure of the surviving population with the age distribution of deaths reported.

TABLE 6.1: CRUDE DEATH RATE BY URBAN/RURAL RESIDENCE, 2005-2010

Year	Entire country	<i>Unit: Deaths per 1000 population</i>	
		Urban	Rural
2005	5.3	4.2	5.8
2006	5.3	4.8	5.5
2007	5.3	NA	NA
2008	5.3	4.8	5.5
2009	6.8	5.5	7.4
2010	6.8	5.5	7.3

Crude death rates (CDR) indicates on average, for every 1000 people in the population, how many deaths have occurred in a reference period, usually in the 12 months prior to the survey time-point. Data from Table 6.1 indicate that the CDR for the entire country was 6.8 deaths per 1000 population, while for urban areas it was 5.5 deaths per 1000 population and in rural areas, 7.3 deaths per 1000 population. The CDR of 2010 has changed insignificantly as compared to CDR of 2009 in entire country and 6 socio-economic regions.

TABLE 6.2: CRUDE DEATH RATE BY SOCIO-ECONOMIC REGION, 2009 AND 2010

Residence/socio-economic region	<i>Unit: Deaths per 1000 population</i>	
	2009	2010
Entire country	6.8	6.8
Urban	5.5	5.5
Rural	7.4	7.3
Socio-economic region		
Northern Midlands and Mountains	6.6	6.6
Red River Delta	7.2	7.1
North and South Central Coast	7.1	7.1
Central Highlands	6.1	6.1
Southeast	6.3	6.3
Mekong River Delta	6.8	6.8

By years, CDR of Vietnam has fluctuated slightly. The CDR is affected by the population age and sex structure. When the share of the population under age 5 (with its relatively high mortality rate) declines under conditions of low fertility, the CDR may also decline. However, growth of the aged population (with its higher age-specific mortality rates) will offset the decline in the number of infant and child deaths. The result is that CDRs may not change at all, or may even increase.

6.2 Infant mortality

Infant mortality rates (IMR) are estimated as the number of deaths to children under age 1 per 1000 live births in the reference period, usually one year. Reports of deaths to children under 1 year of age tend to be incomplete. This is a sensitive question in surveys because relatives do not want to recall the death, so the extent of underreporting may even be larger than for adult deaths. Therefore, these rates must be estimated indirectly. The QFIVE software was used to estimate mortality rates for children under 1 year of age.

Data in Table 6.3 shows that infant mortality rates have declined considerably from 2005 to 2010. In urban areas, IMR has fallen from 10 in 2005 to 9 infant deaths per thousand live births in 2010, while in rural areas IMR has fallen from 20 in 2005 to 18 infant deaths per thousand live births. IMR has continuously decreased, but the reduction is not considerable due to the very low index of IMRs during recent years.

TABLE 6.3: INFANT MORTALITY RATE BY URBAN/RURAL RESIDENCE, 2005-2010

Year	Entire country	<i>Unit: Infant deaths per 1000 live births</i>	
		Urban	Rural
2005	17.8	9.7	20.4
2006	16.0	10.0	18.0
2007	16.0	NA	NA
2008	15.0	10.0	15.0
2009	16.0	9.4	18.7
2010	15.8	9.2	18.2

Although infant mortality overall has declined considerably, differentials between regions remain large. IMR in the Northern Midlands and Mountains and the Central Highlands, two most difficult regions of Vietnam, quite high at 24 and 27 infant deaths per thousand live births in 2010, respectively.

TABLE 6.4: INFANT MORTALITY RATE BY SOCIO-ECONOMIC REGION, 1999, 2009 AND 2010

Unit: Infant deaths per 1000 live births

Residence/socio-economic region	1999	2009	2010
Entire country	36.7	16.0	15.8
Urban	18.3	9.4	9.2
Rural	41.0	18.7	18.2
Socio-economic region			
Northern Midlands and Mountains	43.8	24.5	24.3
Red River Delta	26.5	12.4	12.3
North and South Central Coast	38.4	17.2	17.1
Central Highlands	64.4	27.3	26.8
Southeast	23.6	10.0	9.6
Mekong River Delta	38.0	13.3	12.6

6.3 Levels of mortality by province

The Infant Mortality Rates (IMR) and Crude Death Rates (CDR) for provinces were also indirectly estimated using the same procedures as in calculating IMR and CDR for the whole country and regions. Annex 8 presents IMR and CDR which was indirectly estimated from data collected in the 2010 population change and family planning sample survey. It is necessary to note that the sampling error of IMR and CDR was relatively high, especially for provincial level. The indirect estimation can reduce only non-sampling error, but not sampling one.

Data show that, in general, infant mortality rates of cities directly under the Central government were low: Ha Noi (10.4), Hai Phong (11.5), Da Nang (10.1), Ho Chi Minh City (7.7), Can Tho (9.0). On the contrary, provinces in the mountainous areas have high IMR: Kon Tum (38.1), Gia Lai (25.7), Dak Nong (26.6), Ha Giang (37.1), Cao Bang (28.2), Lai Chau (46.1), Dien Bien (37.3)...

6.4 Cause of death

In the 2010 population change and family planning survey form, some questions were asked to collect information intended for assessing cause of death (especially deaths due to accidents). If a death had occurred in the household, at the time of the survey, the household head was asked about the cause of death of the deceased. The response was coded according to one of the following categories: illness, work accident, traffic accident, other accident and other causes.

TABLE 6.5: PROPORTION OF DEATHS OCCURRING IN THE 12 MONTHS PRIOR TO
THE 01/4/2010 SURVEY BY CAUSE OF DEATH, SEX AND SOCIO-ECONOMIC REGION

Unit: Percentage

Sex/residence/socio-economic region	Total	Cause of death

North and South Central Coast	100.0	80.3	0.6	7.6	2.2	9.2	0.2
Central Highlands	100.0	77.9	4.1	6.1	5.0	6.9	0.0
Southeast	100.0	73.6	0.3	12.1	2.9	11.2	0.0
Mekong River Delta	100.0	86.8	1.9	3.5	1.6	6.2	0.0
FEMALE							
Entire country	100.0	83.5	0.5	1.4	1.4	13.0	0.2
Urban	100.0	85.2	0.1	2.3	0.8	11.6	0.0
Rural	100.0	83.0	0.6	1.2	1.6	13.3	0.2
Socio-economic region							
Northern Midlands and Mountains	100.0	80.3	1.3	0.5	2.0	15.6	0.3
Red River Delta	100.0	88.7	0.5	0.6	0.8	8.9	0.5
North and South Central Coast	100.0	75.0	0.0	3.5	2.1	19.4	0.0
Central Highlands	100.0	87.1	0.0	0.0	2.0	10.9	0.0
Southeast	100.0	81.5	0.0	1.6	2.6	14.2	0.0
Mekong River Delta	100.0	89.7	0.7	1.3	0.2	8.0	0.0

Data indicate that a majority of deaths occurring in the 12 months prior to the survey were due to illness (82.3%). The proportion of deaths from accidents constitutes 7.2%, which is lower than that from other reasons (10.2%). Among deaths due to accidents, traffic accidents accounted for the largest share, three times higher

than work accidents (4.2% versus 1.2%, respectively). The share of deaths due to accidents among males was nearly 3 times higher than among females (9.7% versus 3.4%). In both urban and rural areas, and different socio-economic regions this pattern was generally the same. In the Southeast, the share of deaths due to traffic accidents was the highest (7.6%), and this was also the region with the second highest share of deaths due to any type of accident (10.6%), following the Central Highlands (10.7%).

VII. MIGRATION AND CHARACTERISTICS OF MIGRANTS

Migration is a change in the place of residence of an individual from one territorial unit to another in a given time period. In other words, this is a change in residence over some period of time. There are many reasons for people to migrate, but data of Vietnam in recent years most of them change the residence to look for jobs. Because migration has a great impact on the socio-economic development, this topic attracts attention not only from managers and policy makers, development programs makers, but also from the whole society.

Among the three factors that affect the population size and growth rate of each province (including fertility, mortality and net migration rate), net migration rate calculation is a very difficult task due to the selection characteristic of migration. In-migration and out-migration flows are normally not similar among localities, they only focus on some localities, some regions with various levels. As sample size only presents for provinces/cities, migration rate also presents for provinces, regions and the whole nation.

Basing on information on migration collected from the surveys and cross tabulation between departure places and destinations, one can calculate number of in-migrants and out-migrants, net-migrants and migration rates in 12 months prior to the time-point of survey for urban/rural areas, socio-economic regions and provinces/cities.

7.1 Inter-regional migration

In general, the picture of inter-regional migration is similar to that found in the 2009 Census. In 2010, there were only 2 net in-migration regions (in-migrants exceeded out-migrants), the 4 remaining regions are net out-migration regions (out-migrants exceeded in-migrants). The Southeast continued to attract migrants. The Southeast, which includes Ho Chi Minh City and Binh Duong, is an attractive

destination area for workers throughout the country. It is important to note that in the migration flows to the Southeast, a substantial number of migrants come to pursue their studies or obtain training to improve their qualifications. After completing their studies, they remain to work, satisfying recruitment needs for agencies of the government, organizations, companies, enterprises, and other places in need of highly skilled workers that are still in shortage in the region. If the Central Highlands was a net in-migration region in 5 years preceding the 2009 Census, this region has now begun to have net out-migration (-0.3%). On the contrary, Red River Delta is a net out-migration region in 5 years preceding the 2009 Census, and it now begins to see net in-migration (0.5%).

TABLE 7.1: INTER-REGIONAL MIGRATION IN THE 1/4/2010 POPULATION CHANGE AND FAMILY PLANNING SURVEY

Socio-economic region	Total population on 1/4/2010	Number of migrants in 12 months before 1/4/2010			Migration rate in 12 months before 1/4/2010		
		Number of in-migrants	Number of out-migrants	Net migrants	In-migration rate (%)	Out-migration rate (%)	Net migration rate (%)
Entire country	86 747 807	574 877	574 877	0			
Northern Midlands and Mountains	11 150 794	26 181	69 406	-43 224	2.3	6.2	-3.9
Red River Delta	19 729 612	68 435	59 409	9 027	3.5	3.0	0.5
North and South Central Coast	18 911 046	59 569	166 648	-107 078	3.1	8.8	-5.7
Central Highlands	5 203 606	29 845	31 573	-1 727	5.7	6.1	-0.3
Southeast	14 484 403	359 902	71 060	288 842	24.8	4.9	19.9
Mekong River Delta	17 268 346	30 943	176 782	-145 839	1.8	10.2	-8.4

Data in Table 7.2 shows that in entire country, people moving out of their region of residence tend to move to the Southeast, with the exception of people from the Northern Midlands and Mountains. More than a half (35,756 persons, accounting for 51.5% total of people migrating out of this region) choose to go to the Red River Delta, which contains the major city of Hanoi; only more than a forth (18,602 persons, constituted 26.8% of the region's out-migrants) choose the Southeast to come.

Almost all people leaving other regions prefer to go to the Southeast, especially people from the Mekong River Delta. A vast majority of people from this region (97.4%) went to the Southeast.

In 12 months preceding 1/4/2010, nearly 360 thousand persons throughout the country moved to the Southeast. Mekong River Delta has the largest number of persons who moved to the Southeast (172 thousand persons), followed by the North and South Central Coast (127 thousand persons).

TABLE 7.2: PLACE OF USUAL RESIDENCE ON 1/4/2009 AND 1/4/2010 BY SOCIO-ECONOMIC REGION

Place of usual residence on 1/4/2010	Place of usual residence on 1/4/2009						
	Total	Northern Midlands and Mountains	Red River Delta	North and South Central Coast	Central Highlands	Southeast	Mekong River Delta
Total	574 877	69 406	59 409	166 648	31 573	71 060	176 782
Northern Midlands and Mountains	26 181	-	17 869	2 448	1 973	3 618	273
Red River Delta	68 435	35 756	-	21 092	2 271	8 018	1 298
North and South Central Coast	59 569	4 553	9 561	-	9 337	34 474	1 645
Central Highlands	29 845	7 386	5 204	11 780	-	4 139	1 336
Southeast	359 902	18 602	24 333	126 875	17 861	-	172 231
Mekong River Delta	30 943	3 108	2 441	4 452	131	20 811	-

Among four regions that had net out-migration (net migration has the negative value), North and South Central Coast and the Mekong River Delta took the largest amount, accounting for 167 and 177 thousand persons respectively. Number of out-migrants of Central Highlands is the lowest.

From the above findings, we can conclude that, the main factor driving the choice of destination region for migrants is employment. The next most important factor is distance as most migrants seem to prefer migrating to neighbouring regions. This is easy to understand because Vietnamese people, when migrating, want to remain close to their origins and relatives. In particular, almost all migrants from the Mekong River Delta chose to migrate to the Southeast.

7.2 Inter-provincial migration

Annex 9 presents data of inter-provincial migration for 12 months preceding the 1/4/2010 survey time-point.

For data of the 2010 population change survey, one forth of total provinces (14/63 provinces) has positive net migration rate (number of in-migrants exceeds number of out-migrants), remaining provinces have the negative net migration rate (number of out-migrants exceeds number of in-migrants). Some provinces has the highest positive net migration rate, those are Binh Duong (75 migrants/1000 persons), Da Nang (26 migrants/1000 persons), Ho Chi Minh City (18 migrants/1000 persons), Dong Nai (16 migrants/1000 persons) and Hanoi (6 migrants/1000 persons). Regards to provinces that have high in-migration rate, it is necessary to find appropriate and effective solutions in order to ensure living condition for in-migrants such as housing, employment, schools...

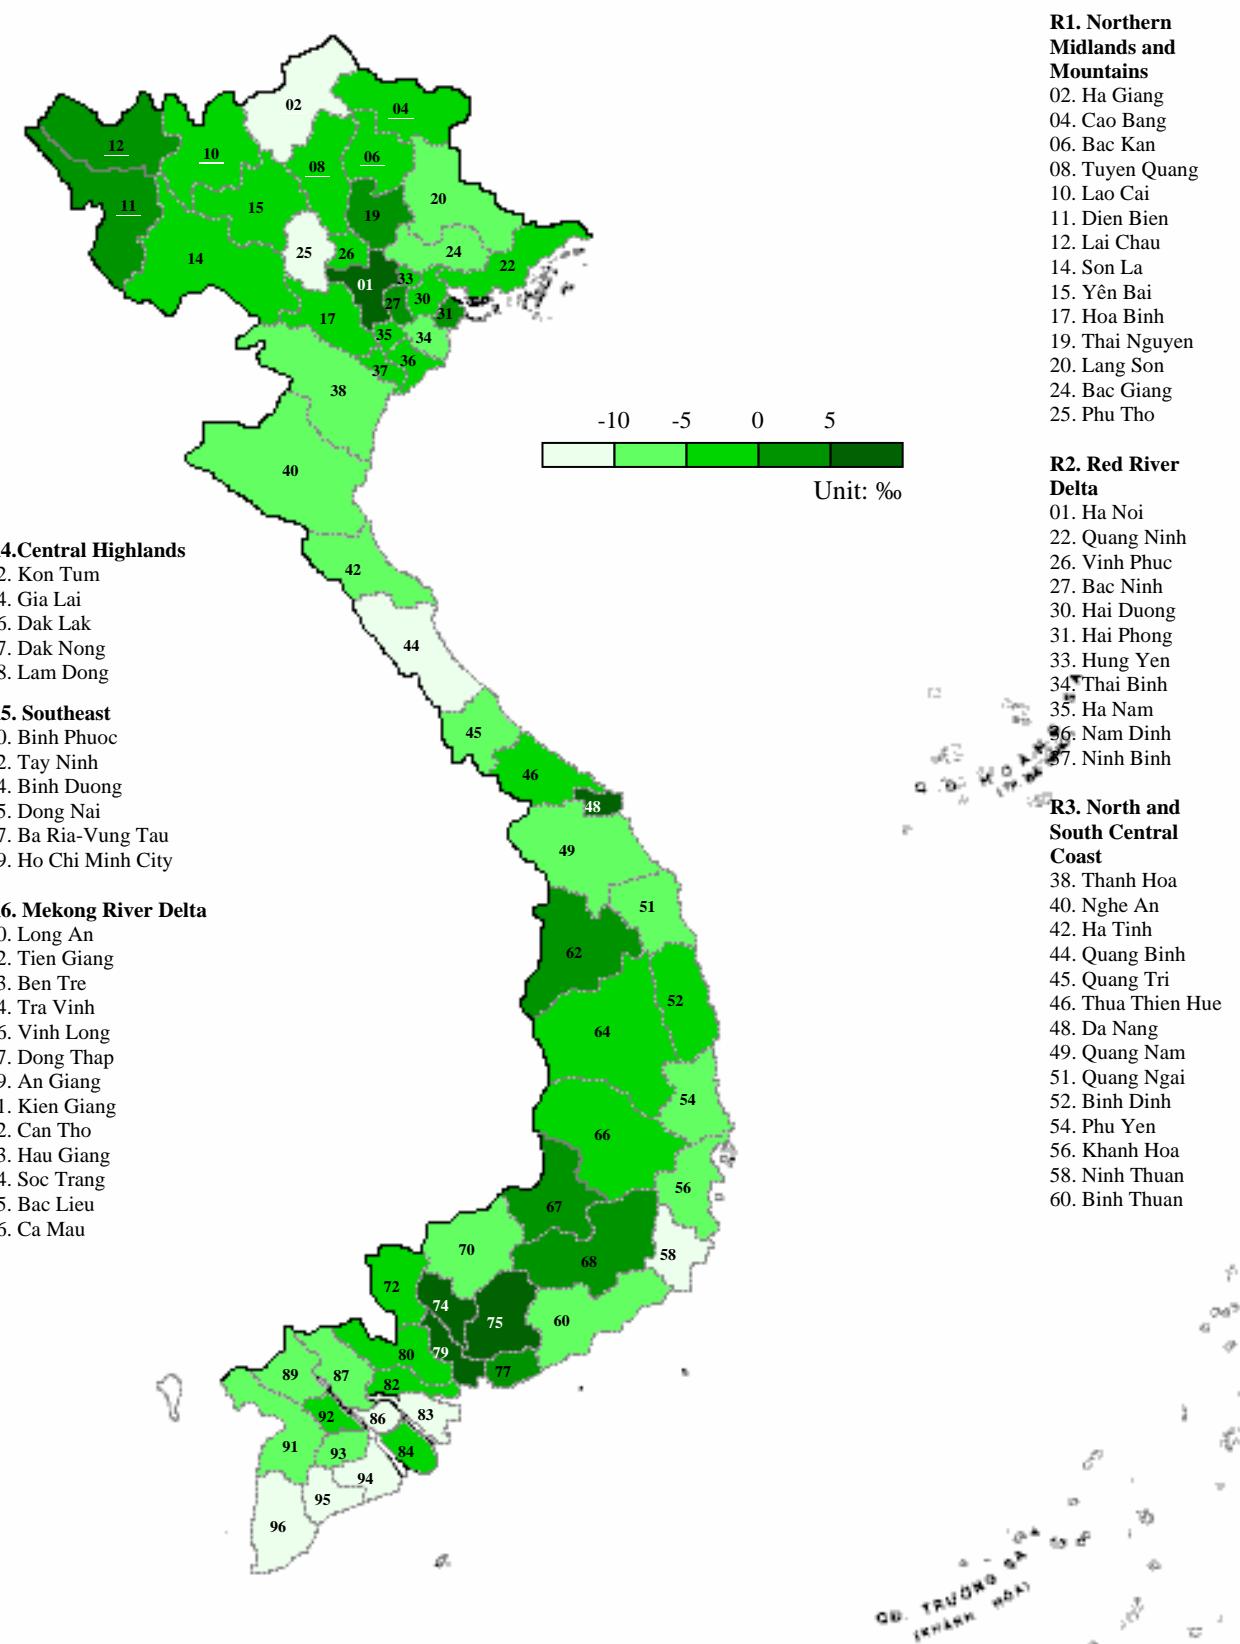

Provinces that have highest negative net migration are Ca Mau (-27 migrants/1000 persons), Ha Giang (-17 migrants/1000 persons), Ninh Thuan (-14 migrants/1000 persons), Vinh Long (-61 migrants/1000 persons), Ca Mau (-57 migrants/1000 persons), Thai Binh (-13 migrants/1000 persons), Ben Tre (-13 migrants/1000 persons), Phu Tho (-12 migrants/1000 persons), Quang Binh and Bac Lieu (-11 migrants/1000 persons) and Soc Trang (-10 migrants/1000 persons).

As mentioned above, the Southeast is a region that has net in-migration. Almost all provinces of this region have positive net migration rate, except for Binh Phuoc and Tay Ninh that have negative net migration rate. Out-migrants were from Binh Phuoc and Tay Ninh who choose more developed provinces in the region to move for their life.

Red River Delta begins to have net in-migration and the two economics leading provinces of the Northern main-point economics region, that is Hanoi and Hai Phong, have positive net migration rates.

All provinces in the Mekong River Delta have negative net migration rate. Migrants of this region mainly choose Ho Chi Minh City and Binh Duong province to come for working and living.

MAP 7.1: INTER-PROVINCIAL NET MIGRATION RATE, 2010

7.3 Rural - Urban migration flow

Among migration flows, rural - rural migration is the biggest flow (accounting for 42.1%), replacing the previous flow of rural - urban migration. This change is because in the current years, in rural areas, many industrial zones and export processing zones have been established, attracting a great number of labor force from other regions. Big factories that have great number of employees have been moved gradually from inner to suburbs of the cities.

TABLE 7.3: PLACE OF USUAL RESIDENCE ON 1/4/2009 AND 1/4/2010 BY URBAN/RURAL RESIDENCE

Place of usual residence on 1/4/2010	Place of usual residence on 1/4/2009			Proportion (%)		
	Total	Urban	Rural	Total	Urban	Rural
Total	2 064 049	743 593	1 320 456	100.0	36.0	64.0
Urban	985 014	533 497	451 517	47.7	25.8	21.9
Rural	1 079 034	210 096	868 938	52.3	10.2	42.1

It is different from rural - rural migration flow, urban - rural migration flow is always accounting for the smallest percentage with 10.2%, because employment source are always more abundant in urban areas than in rural areas.

In 2007-2009, due to effects of the global economic crisis, many labors have left urban areas, industrial zones and export processing zones to go back to live in their hometown. However, in 2010 economic situation have been improved, when crisis is over, many labors have gone back from rural areas to urban areas, industrial zones to find the work.

TABLE 7.4: IN-MIGRATION RATE BY URBAN/RURAL RESIDENCE, 2007-2010

Year	Population		In-migrants		In-migration rate (%)	
	Urban	Rural	Urban	Rural	Urban	Rural
2007	22 800 417	61 398 196	320 081	238 548	3.8	2.8
2008	23 765 751	61 420 415	193 882	227 905	2.3	2.7
2010	25 923 749	60 824 058	451 517	210 096	5.2	2.4

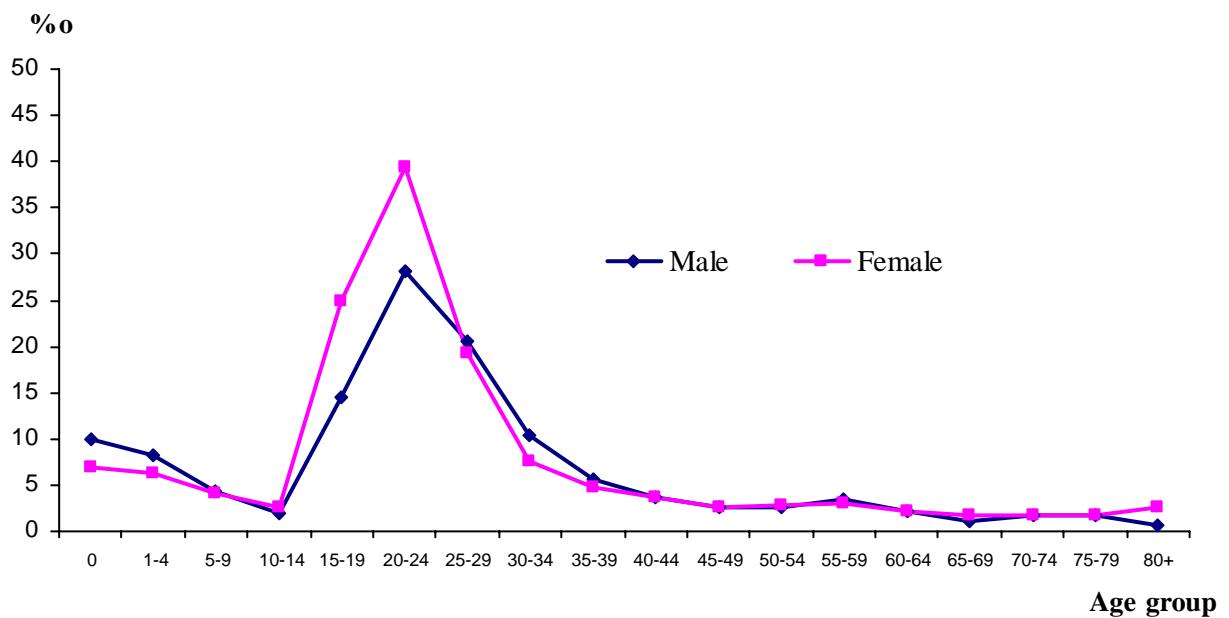

For rural – urban migration flow, number of in-migrants of urban areas is number of out-migration of rural areas, and vice versa. Migration trend of labor in and after the economic crisis is seen clearly through in-migration rates presented in Table 7.4. Particularly, in the period of 2007-2010, in-migration rate of rural areas (or out-

migration rate of urban areas) was highest in 2007 (2.8‰) and in-migration rate of urban areas (or out-migration rate of rural areas) was highest in 2010 (5.2‰).

7.4 Major characteristics of migrants

Figure 7.1 presents migration rate by age group and sex. Migration rate of persons aged 15-29 is highest, this is understandable because the age of 15-29 years is when people have to migrate for the sake of study and working, while migration in the age of 0-14 years mainly for following family's movements, and in the age of 30 years and over, almost all population have a stable life thus their migration is more limited. In young age groups (0-9) and main labor age groups (25-39), migration rate of males is higher than that of females. On the contrary, in youth age groups that are attending school (10-24), migration rate of females is higher than that of males. This reveals that males migrate mainly for job sake while almost young females migrate for the reason of study.

Figure 7.1: Specific migration rate by age and sex, 2010

Persons who graduated upper secondary schools have highest migration rate (27.7‰), and that rate of females is 10.3‰ points higher than that of males (33.1‰ compared to 22.8‰). Generally, low educational level leads to low migration rate, this can be easily explained because almost every person move for the sake of job just after they graduate from a certain educational level, while number of persons who are still attending some educational level have to move following family's movement is very few.

TABLE 7.5: MIGRATION RATE OF POPULATION AGED 5 YEARS AND OVER IN 12 MONTHS
PRECEDING THE SURVEY BY SEX AND EDUCATIONAL LEVEL, 2010

Educational level	Total	Male	Female
Total	9.9	9.1	10.6
Never attended	4.5	4.8	4.3
Some primary	4.3	4.1	4.4
Completed primary	6.9	6.0	7.7
Completed lower secondary	8.9	8.2	9.6
Completed upper secondary	27.7	22.8	33.1
Technical qualifications	14.4	13.9	15.0

The majority of migrants are never-married, the migration rate of never-married persons is highest (22.6%). Widowed persons have the lowest migration rate (3.4%). Migration rate by marital status shows that almost migrants for the sake of job, number of migrants for the reason of marriage is not very common.

TABLE 7.6: MIGRATION RATE OF POPULATION AGED 15 YEARS AND OVER IN 12 MONTHS
PRECEDING THE SURVEY BY SEX AND MARITAL STATUS, 2010

Marital status	Total	Male	Female
Total	11.3	10.5	12.1
Never-married	22.6	19.7	26.2
Currently married	7.8	6.9	8.7
Widowed	3.4	3.0	3.5
Divorced/Separated	8.6	6.8	9.4
