Ministry of Planning

Localization of Millennium Development Goals
through Commune-Based Monitoring System
(CBMS)

This work was carried out with the aid of grant from the PEP-CBMS Network
with support from the International Development Research Centre (IDRC)

Forward

It is my pleasure to introduce you to the “Facts of Poverty” of five communes in Snuol District, Kratie Province. The “Facts of Poverty” in Snuol District derived from the implementation of a project for Community-Based Monitoring System (CBMS) in Cambodia carried out by councilors of five communes namely Snuol, Pir Thnou, Srechar, Khsem, and Svay Chras in Snuol district.

CBMS is part of the Poverty and Economic Policy (PEP) Network supported by the International Development Research Centre (IDRC) Canada through its Globalization, Growth and Poverty (GGP) Initiative, the Canadian International Development Agency (CIDA) and the Australian Agency for International Development (AusAID). To date, the Network has facilitated the development and implementation of CBMS in about 15 countries covering Bangladesh, Cambodia, Indonesia, Lao PDR, Pakistan, Philippines and Vietnam in Asia; Benin, Burkina Faso, Ghana, Kenya, Nigeria, Tanzania and Zambia in Africa; and Peru in Latin America.

CBMS in Cambodia firstly and successfully piloted in 2004 in two districts within two provinces, Ek Phnom and Snuol district in Battambang and Kratie province respectively. After piloting, CBMS was implemented in the second stage covering twelve communes, six communes in previous sites in pilot stage, and other six communes in Stung district, Kratie province.

CBMS is one of the tools developed to provide policymakers and program implementers with a good information base for tracking the impacts of macroeconomic reforms and various policy shocks. It is an organized way of collecting information at the local level for use of local government units, national government agencies, non-government organizations, civil society and development partner agencies for planning, program implementation and monitoring.

CBMS also attempts to build and strengthen the capacity of planners and program implementers at the national and local levels for an improved and more transparent system of resource allocation and governance. A major objective of CBMS is to assist in poverty reduction. In so doing, there are other corollary benefits achieved like building the capacities of local government units, increasing gender equity, and eliciting early warning signs of crisis.

Finally, I would also like to take this opportunity to express my sincere gratitude to CBMS Network coordinator in ASIA, Dr. Celia. M. Rey, and her colleagues for their valuable supports including technical assistance as well. Deep and high appreciation should also be given to IDRC Canada who continuously provided financial assistance since CBMS in Cambodia, Phase 1 till phase 3. Without their supports and assistances, such important report would not have appeared.

ABSTRACT

Commune-Based Monitoring System (CBMS) in Cambodia has been carried since 2004 in different three phases

Cambodia is committed to a long process of decentralization. The importance of local governance is well recognized by all of Cambodia's stakeholders, and many are working to contribute to enhancing the success of this reform. Naturally, commune councils need adequate systematic and reliable information in order to conduct their needs assessments, planning, monitoring and evaluation of development projects. The Community-Based Monitoring System (CBMS) in Cambodia generally aims to provide practically generated data to commune councils for their planning, monitoring and evaluation of development projects. To meet the long-term objective of creating a sustainable system to locally monitor poverty reduction over time, the project emphasizes on institution and capacity building at the local level. A total of 11,776 households were surveyed as part of the Cambodia's CBMS conducted in 2010. These households represented five communes in the whole Snuol districts, Kratie province. As a census at the commune level, knowledgeable villagers were recruited and trained to undertake the household interviews based on a six-page questionnaire. Data were processed at two levels, first level is manual editing (checking and coding) under the management of the commune councils, and second level is computer processing at the provincial level (coding, data entry and cleaning) and under technical supervision of the project Supervisory Team. As a result, these five communes in this census undertaking were able to produce their own report of their community that they use for planning and monitoring purposes. In addition to determining the poverty rates at the village level, the exercise provided scientifically generated statistics regarding demography, education, housing, land, water, health, household expenditure, occupation and income, assets, livestock, and domestic violence. It is expected that the data will be periodically updated, perhaps every two or three years. The results have been widely shared with various stakeholders for possible consideration of adoption in other areas. As part of the successful advocacy for the CBMS, the Government of Cambodia, the NIS, as such, the only institution approved by law will use CBMS as model to create statistical activities until the commune level to help a new research program on developing statistics for local development planning on local governance and decentralization, a five-year commitment strongly supported by the Cambodian Government and major donors, which is an effort to discuss various approaches for identification of poor households under the umbrella of poverty rate reduction strategy.

1. Introduction

The Community-Based Poverty Monitoring System (CBPMS) was successfully pilot-tested in Cambodia in 2004 by the Cambodia Development Resource Institute (CDRI) in close collaboration with the National Institute of Statistics and the Seila programme. It provided valuable results, which satisfactorily describes the different facets of poverty in 6 communes in two different provinces-Battambang and Kratie. Poverty rates based on household consumption and poverty lines comparable to the national one were estimated for both the village and commune level. The pilot project has successfully promoted links between the communes; provincial and national level planning processes through the use of CBMS data. The project has developed the capacity of local authorities to implement the CBMS in their localities. To meet the long-term objective of creating a sustainable system to locally monitor poverty reduction over time, the project will place emphasis on institution and capacity building at the local level and leadership by the National Institute of Statistics.

The CBMS provides a basis for the Ministry of Planning to draw on experience in combination with the qualitative method of identification of poor households by other NGOs in order to establish a national system of identifying poor households. The Ministry of Planning has established a “Working Group on Poor Household Identification” (WGPHI) of which CDRI and NIS are members. The working group has been studying a set of indicators that best predict the poverty status of the households with the objective to establish a simple, statistically sound tool that can be implemented to identify poor households nationwide to serve the targeting purpose. It is envisaged that the CBPMS will further contribute to this process.

NIS has taken over the management responsibility from CDRI after the Pilot stage was over to gradually expand the coverage with the same amount of funding. There are two parts of the current project or Phase II. The first part is to repeat the implementation of the CBPMS in the piloted six communes that consisted of some 12,000 households and located in two districts in two provinces. It is expected that the communes will have the capacity to repeat the exercise with minimal technical support from the provincial and district offices. This part is the consolidation of Phase I and to prove that the CBMS can be done efficiently when it is implemented by the built local capacity.

The second part of the project is to expand the coverage to cover one full district in one of the poorest provinces. The identified province is Kampong Thom, which was estimated to be one of the three poorest provinces by the national socio-economic survey in 2004. Poverty rate in this province was 53%. Stoung District was chosen for full coverage in the second part of this project. It has a total of approximately 20,000 households living in 13 communes.

The third phase of the project was implemented in 2010 covering the all five communes in Snuol district, Kratie province. The implementation of CBMS has done within the period of global financial crisis (GFC)--coming on the heels of a devastating global food crisis--is likely to have

severe consequences on enterprises, workers and families around the world. Jobs are likely to be lost in some sectors, while new jobs may be created in others. Given that there is already a recession in major global markets, new jobs, if created, are likely to be in the informal economy where productivity, wages and conditions of work are poor. The ILO projects that as a result of the financial crisis, global unemployment could increase by 20 million by the end of 2009 and the number of the working poor living on less than two dollars a day could rise by more than 100 million. These projections could get much worse if the effects of the current economic contraction and looming recession are not quickly confronted. The impacts of the financial crisis have a wide spillover effect on Cambodia's economy, trickling down to many layers - global, macro, sector, labor market, and household.

Cambodia is committed to undergo a long process of decentralisation. As part of this, a local election in the Cambodian history was conducted in February 2002 to elect "commune councils" charged with local development planning and implementation. The importance of local governance is well recognized by all of Cambodia's stakeholders and many are working to contribute to enhancing the success of this reform process. The NIS has received a mandate from the recently passed Statistical Law to expand its statistical activities down to the commune level. The NIS is proposing a new research programme on developing statistics for local development planning on local governance and decentralisation, a five-year commitment strongly supported by the Cambodian Government and major donors.

A CBMS has nicely complemented such decentralisation efforts in a concrete way and contribute to successful functioning of the new decentralised state apparatus. As mentioned above, Cambodia lacks a community-based monitoring system, although there is a commune database, collected through administrative reports under the Seila/PLG Programme and now known as the National Committee for Sub-National Democracy Development (NCDD). Naturally, commune councils need adequate information, generated in a systematic and reliable way in order to effectively conduct their needs assessments, planning, monitoring and evaluation of development projects. The best way to achieve this is to establish a national system and have it operated in a consistent manner by the commune councils, with technical support from the district and provincial statistics offices and other agencies.

Due to unavailability of the district data which makes councilors hard to implement the development planning, CBMS takes a crucial part in pushing their plan ahead and ensures the successfulness of D&D reform. Moreover, it has a strong emphasis on capacity building in the previous phases. It is expected that the communes and districts will have the capacity to repeat the system with minimal technical support from the provincial and district offices. This part is the consolidation of previous phases and to prove that the CBMS can build local capacity efficiently when it is implemented.

The proposed CBPMS project is to be supported by the PEP-CBMS sub-network. The CDRI has successfully piloted this exercise in the past three years with an explicit aim to hand over the project to the National Institute of Statistics, a national institution that can nationalize the system. While CDRI is still engaged in the Project Advisory Team, the NIS assumes a leading and management role in institutionalizing the CBPMS. As will be explained below, the "Project Management Team" within the NIS and the "Project Advisory Team" comprising of members from key stakeholders has been formed to implement the project.

2. Objectives of the CBMS Phase III

The main objective of the study as follow:

- To build capacity of the communes and districts covered in the previous project in carrying out the CBMS independently.
- To document the use of CBMS data at the national and local levels for commune-based poverty monitoring and analysis.
- To provide practical, scientifically generated data to commune councils for their effective planning, monitoring and evaluation of development projects.
- To produce Commune Poverty Monitoring Reports based on the CBMS results.
- To build capacity of the selected commune councils in survey methods and data processing, analysis and use.
- To promote the link between commune and provincial/national level planning processes in utilizing CBMS data.
- To cement the link between PMATU, NIS and commune and district councils and to prepare for an eventual nation-wide CBMS.
- To promote a firm process of decentralisation this has the high commitment of Government and donors.

3. Authority for the Survey

The National Institute of Statistics (NIS) has provided technical support to the local authorities downward to the commune level. Article 9 of the Statistics Law which promulgated in May 2005, the NIS has its statistical structure downward to communes. The NIS recognizes and supports to the CBMS as one a main tool for strengthening local statistical system. The NIS has organized the CBMS technical working group for establishing CBMS partnership, resource mobilization and technical provision to communes where CBMS adopted. The technical working group has its members from the Provincial Department of Planning and District Office of Planning.

The NIS is the principal agency of the Royal Government of Cambodia (RGC) responsible for collection, compilation, analysis, publication, and dissemination of the statistical data and information relating to the Socio-Economic condition of the people in private and government

establishments and enterprises, including demographic statistics, national accounts, consumer price indices and other related services within the Kingdom of Cambodia. The NIS is also mandated to take charge of maintaining, updating and implementing of the statistical program for the Cambodian Government and other statistical data users. The responsibility of coordinating with other government statistical agencies and development partners is also a function of the institution

Selection of site A total number of 11,776 households in five communes of an entire district of Kratie provinces have been selected to interview for the CBMS sites. Those five communes are Snuol, Khsem, Sre Char (previous CBMS site), Pir Thnu and Svay Chras (new CBMS site). There are about 45 villages of all five communes were selected for the CBMS phase 3.

5. Training and Survey Operation

5.1. Training

Training on data collection was conducted on 03-05 March 2010 at Snuol district in 3 classes of primary school locations. There were about 127 trainees; 15 commune councillors of 5 communes, 45 village chiefs, and 67 enumerators received training of data collection methods, supervision, and guidance. The training took place 2 days and one extra day for pre-testing and reviewing feedback from the field pre-testing. It was found that school teachers, and young people, absorbed instructions quickly as compared to the non-teachers and aged people. Former enumerators in pilot CBPMS were also found to be able to understand quickly.

Due to distance and number of trainees constrain, the training classes were divided into 3 classes at two different primary schools, which two classes in Snuol commune and another one in Svay Chras commune which locates about 50 kilometres from the district town. Each class consisted of about 45 trainees that is considerable for the quality of training. Considering distance from the district town, the communes that locates close together were combined into one class. Srechar and Pir Thnu in one class; Snuol and Sre Char in one class; and Svay Chras is in one class because it is very far from the Snuol town.

At the third day, the participants were requested to interview each other using the household questionnaire. The respondent acted as a head of household and was made to answer all the questions as read by the interviewer and then the interviewers became respondents. The exercised questionnaires were collected and corrected by lecturers (supervisory members). Feedbacks received after each exercise was discussed during the lecture time. The exercises were done in all training sessions of data collection. Participants were provided the floor to raise ideas and experiences found in the piloted project 2004 and 2006.

5.2. Fieldwork launch

After field training sessions and pre-testing were over, field work was immediately launched on 08-10 March 2010. Local enumerators in cooperation with village chiefs and commune councillors started to do mapping before household listing. Village chief drew his own village's draft map assisted by enumerator. The village chief also assisted the enumerators by giving geographical guidance and making household appointments.

Enumerators held draft map guidance, and they listed households and posted stickers on the place of the house that is safe and easy to see. The village chief and enumerators discussed the starting point and the direction they are to take until they reach the last household. Households listed were also drawn on the map and ID of household is placed in the map. The direction from the start point to the end point follows the second watch.

The household listing exercise is to provide ordinal number of households from one side of the village to another, which starts from the starting point in the village. A form for household listing was provided to enumerators. Household listing form provides information on building/house number; household number; name of household head; address; number of male and female and total of usual members; and occupation of household head. The ordinal number of household is the serial number of questionnaire for the household. It is used as an ID number of the household.

The household listing exercise served the purpose of verifying as well as updating the number of households in the village, based on the definition adopted for the CBMS system. Based on this exercise, the exact number of households is counted. Stickers written with province code, district code, commune code, village code, building/house number and household number posted on the door or the safe-see able place. Based on the sticker, enumerator could use to write down serial number of the household from posted sticker in the household questionnaire before interviewing or enumerators kept a copy of the household listing, which provides for the household ID number to be written on the questionnaire. The village chief and the commune councils can also use the household list for administration and governance purposes in their village and commune. Depending on the size of the village, the interviews took 2 to 4 days for a village for the purpose of household listing. The enumerators worked under close supervision of a commune council member, district and provincial partners who reported directly to the Supervisory Team.

6. Data Processing System

After manual data cleaning, data entry was done at the provincial level by CBMS team members at the province and provincial planning and statistics staff. Data entry took more than two months to be completed due to the shortage number of computers available in the Planning Department. Because of the lack of PCs, only few staff in planning office will be served to enter data. Before that, training of SPSS software program was conducted within a few days for data entry, data cleaning (computer) and analyze at provincial level to CBMS team members at the

province and provincial planning and statistics staff. The CBMS supervision team members from the central are supervised data entry data cleaning. In case of errors were found, responsible enumerators were requested to re-interview those error data of households. Errors were mostly related to household income, expenditure, own assets, and GFP impacts.

The tools for data entry had been developed by CBMS team, SPSS and Excel spreadsheet were used for computerised processing developed and trained to the provincial planning statistics officers. SPSS and Excel was used in preparation of data entry software and SPSS also used for cleaning data to verify the accuracy of manual processing and data analysis of the results for the commune level and district level. The data files created through this system are in SPSS format and the variables in each data file can be identified using the data dictionary that is based on SPSS.

The input documents were the CBPMS questionnaires and the data entry system was designed to input data of each type of questionnaire separately. The household questionnaire (Form B) were created separately in two parts (i) individual data file called individual file (File A), and (ii) household data file (File B). The listing Form (Form A) and the household questionnaire (Form B) were used to create separate files for each village.

Data entry for computer processing was only done at the provincial level. This cannot be done at the district and commune level due to lack of manpower, computer and electricity. With the limited number of computers and staff at the provincial level and with the large number of respondents, we decided to send some the questionnaires to the NIS for assisting data entry.

7. Explanatory Text

7.1. CBMS Core Indicators

The CBMS core indicators are carefully produced based on the results of the CBMS which is adopted and recognized as a nice and effective tool of collecting, generating, analyzing data at community level. It provides a set of poverty indicators reflecting the real situation of selected local communities where CBMS has been adopted.

CBMS core indicators are a set of selected indicators that capture the multiple dimensions of poverty. They define the basic criteria in corresponding to the minimum of basic needs for life, covering core dimensions of poverty as: 1) demography and health, 2) housing, 3) water and sanitation, 4) education, 5) employment, 6) poverty, 7) social disorder, and 8) disaster.

The CBMS core indicators are provided with the ideal of localizing Cambodia Millennium Development Goals (CMDG) for policy and decision maker, and supporting to development planning formulator at the community level. Together, these indicators provide information not only on how poor a community is, but also who in the community is poor, and where the poor are.

CBMS core indicators are basically generated using the CBMS model. The CBMS is an organized and structured way of collecting ongoing or recurring information at the local level to be used by local government agencies, non government organization

(NGOs), civil society, and including local private sector for their planning, budgeting, and implementing local development plans and programs.

Main Activities of CBMS of Cambodia

- 1- Partner establishing and tool design
- 2- Developing CBMS tools
- 3- Testing designed tools
- 4- Main census/ main data collection and field editing
- 5- Data consolidation, processing, and database building
- 6- Data analysis and poverty map construction
- 7- Data validation and commune council consultation
- 8- Results of findings
- 9- Results dissemination

Table A: The CBMS Core Indicators of Cambodia

Basic Need		Core indicator	Method of Computation	Simple scoring
Demography and health	1	1- Proportion of children age 0- 5 who died	Total number of children aged 0-5 years who died divided by total children aged 0-5 years old plus the total number of child deaths aged 0-5 years old	Code 1= Household has a member 0- 5 years old who died; code 0= otherwise
	2	2- Proportion of women who died due to pregnancy-related causes	Total number of women who died due to pregnancy related causes divided by (total number of children less than one year old plus total number of women who died due to pregnancy-related causes	Code 1= If the household has female member who died due to pregnancy-related causes; code 0= otherwise
	3	3- Proportion of person who got sick of Malaria decease	Total number of persons who got sickness of Malaria decease divided by total number of persons who got sickness	Code 1= Household has a member who got malaria sickness; code 0= otherwise
Housing	4	1- Proportion of households living under makeshift/ salvage house/ dwelling	Total number of households living under makeshift housing divided by total number of households	Code 1= Household living under makeshift housing; code 0= otherwise
	5	2- Proportion of household using own dwelling	Total number of households occupying own dwelling divided by total number of households	Code 1= Household living with own dwelling; code 0= otherwise
Water and sanitation	6	1- Proportion of households without access to safe water supply	The sum of households without access to safe water supply divided by total households	Code 1= Household has no access to safe water supply; code 0= otherwise
	7	2- Proportion of households without access to sanitary toilet facilities	The sum of households without access to sanitary toilet facilities divided by total households	Code 1= Household has no access to sanitary toilet facilities; code 0= otherwise
Education	8	1- Illiteracy rate	Total number of illiterate person aged 7 years and over divided by total number of persons aged 7 years and over	Code 1= Illiterate person; code 0= otherwise
	9	2- Proportion of children aged 6-11 who are not attending primary school	The sum of children aged 6-11 who are not attending primary school over the sum of children aged 6-11 years old	Code 1= Children aged 6-11 who are not attending elementary school; code 0= otherwise
	10	3- Proportion of children aged 12-14 who are not attending lower secondary school	The sum of persons aged 12-14 who are not attending lower secondary school over the sum of persons aged 12-14 years old	Code 1= persons aged 12-14 who are not attending secondary school; code 0= otherwise
	11	3- Proportion of children aged 6-14 who are not attending school	The sum of children aged 6-14 who are not currently studying over the sum of children aged 6-14 years old	Code 1= Children aged 6-14 who are not currently studying; code 0= otherwise
	12	4- Ratio of girl to boy aged 6-24 years old who are attending school	Total number of girls aged 6-24 years old who are attending school over total number of boys aged 6-24 years old who are attending school	Code 1= 100%; 2= >100%; 3= <100%
Employment	13	1- Unemployment	Total number of person aged 10 years and over who are not working over total number of person aged 10 years old and over	Code 1= Unemployed; code 0= otherwise
	14	2- Proportion of children aged between 5-17 years old who are working	Total number of children aged 5-7 years old who are working over total number of children aged 5-17 years old	Code 1= Children aged 5-17 years old who are working; code 0= otherwise
Poverty	15	1- Proportion of household living under national poverty line	Total number of household with expenditure below national poverty line over total number of households	Code 1= If household has expenditure below national poverty line; code 0= otherwise
	16	2- Proportion of households living below national food poverty line	Total number of household with expenditure below national food poverty line over total number of households	Code 1= household has expenditure below national food poverty line; code 0= otherwise
Social disorder	17	1-Proportion of households with members who are victims of attack	The sum of households with member(s) who are victim of crime divided by total households	Code 1= Household has member experienced victim of crime; code 0= otherwise
	18	2- Proportion of households with members who experienced domestic violence	The sum of households with having domestic violence divided by total households	Code 1= Household has member experienced domestic violet; code 0= otherwise
Disaster	19	1- Proportion of household experienced from huge disaster	Total households experienced from huge disaster over total households	Code 1= Household has member experienced huge disaster; code 0= otherwise

Table B: Basic Assumption of Computing Rural Poverty Line

- Using national rural poverty line in 2004 as a base to generate PL for 2005 and 2006
- Using national rural poverty line in 2007 as a base to generate PL for 2007 to 2011
- Adjusted with average national inflation based on NIS price survey

Poverty line as 2004 based

2004		2005		2006	
PL	IR	PL Est.	IR	PL Est.	IR
1,753	3.9	1,855	5.8	1,942	4.71

Poverty line as 2007 based

2007		2008		2009		2010		2011	
PL	IR	PL Est.	IR	PL Est.	IR	PL Est.	IR	PL Est.	IR*
2,367	5.9	2,833	19.7	2,813	-0.7	2,926	4	2,938	0.4

Note:

PL: Poverty Line Based

PL Est.: Poverty Line Estimate by Inflation

IR: Annual Inflation Rate

IR*: Inflation of first quarter in 2011

Table C: Color ranges for Poverty Maps

Basic Need	Core indicator		Color ranges			
			Green	Light green	Pink	Red
Demography and health	1	1- Proportion of children 0- 5 who died (%)	< 0.5	0.5-1.0	1.01-1.5	1.51 and more
	2	2- Proportion of women who died due to pregnancy-related causes (%)	< 0.5	0.5-1.0	1.01-1.5	1.51 and more
	3	3- Proportion of person who got sick of Malaria decease	< 10.0	10.0-19.9	20.0-29.9	30.0 and more
Housing	4	1- Proportion of households living under makeshift roof of dwelling 2- Proportion of households living under makeshift wall of dwelling	< 20.0	20.0-39.9	40.0-59.9	60.0 and more
	5	3- Proportion of household using own dwelling	80.01 and more	70.01-80.0	60.0-70.0	< 60.0
Water and sanitation	6	1- Proportion of households without access to safe water supply	< 20.0	20.0-39.9	40.0-59.9	60.0 and more
	7	2- Proportion of households without access to sanitary toilet facilities	< 30.0	30.0-49.9	50.0-59.9	60.0 and more
Education	8	1- Illiteracy rate	< 20.0	20.0-39.9	40.0-49.9	50.0 and more

**Province of Kratie
Provincial Cabinet
Governor's Message**

It is my highest appreciation that my province is having a indispensable results on “The Facts and Poverty” derived from the project of Commune-Based Poverty Monitoring System (CBMS) which has been implemented in Snuol district, Kratie province. It is also my great pleasure and high appreciation to the CBMS team and involved commune councilors for producing this scientific compilation of statistical tables and poverty maps of five communes.

As we are aware, Cambodia now is fighting with poverty since the country recovered from the civil war more than two decades. Poverty is a major concern in all levels of society both locally and internationally. For local chief of commune councilors, planners, decision makers and other development practitioners, this document provides critical information and data on the different aspects, situations, and conditions of poverty reflecting to the real situation of the communities.

Indeed this publication compels all local chief executives and planners not only to take a critical look at the poverty situation in our respective backyards but also, and more importantly, to map out appropriate, concrete, and timely interventions to alleviate the poverty for a better future of not only our generation but also the next generation in the communities.

As a proof, after the adoption of CBMS in this district since 2004 as a pilot testing, it was observed that this area has been gradually developed and the living condition of people has been remarkably improved. Infrastructure like community road, water irrigation system, electricity channel, etc has been improved comparing to before adoption of CBMS. In this sense, CBMS has become an indispensable instrument in providing the benchmark for development and in determining the socio-economic conditions in all levels of government from the Kratie Province, Snuol district to the communes. Likewise, the CBMS also serves as a gauge in analyzing the responsiveness of interventions to target communities toward the improvement of the welfare conditions of our people. This compilation is treated as an important compilation of CBMS data, moves us toward a more concrete, pro-active and concerted course of action to improve and upgrade the lives of our poverty-stricken countrymen and empower them to finally achieve every man's dream and desire for a better quality of life.

Finally, on behalf of Governor of Kratie province, I would like to express my sincere regards and deepest thank to PEP-CBMS Network, especially IDRC Canada, for providing financial assistance to CBMS Cambodia. I also never forget to give my high appreciation to the National Institute of Statistics (NIS), Ministry of Planning (MoP), especially Cambodia CBMS Team for their hard work to produce such indispensable document. In the vision of expanding CBMS in the whole areas of Kratie province, I will do all my best efforts to mobilize any possible resources.

Province of Kratie
District of Snuol
On behalf of Heads of Five Communes of Khsem, Pir Thnu, Snuol, Srechar, and
Svay Chras
Commune Head's Message

It is our great pleasure that we could release “The Facts of Poverty in 2010” which is a comprehensive report mirroring the real situation in our community. This comprehensive study was conducted by our commune councillors of Snuol, Pir Thnou, Srecha, Kshem, and Svay Chras commune in technical cooperation with the National Institute of Statistics (NIS), Ministry of Planning (MoP). A similar report on “Commune Poverty Profile” had been also released in 2006 and 2004, initiated by Cambodia Development Research Institute (CDRI), NIS and SEILA Programme.

Based on experiences from the past in 2004 and 2006, this report has been much improved than before in order to satisfy users in general, and for commune councillors of the said communes in particular for using toward community development. Indicators calculated in this report are basic ones reflecting the real situation on socio-economic at the community level.

Collective indicators such as demography, education, occupation, disability, health, household dwelling, source of drinking water, sanitation, natural disaster and losses, agriculture land ownership, income and expenditure, poverty, domestic violence, and social disorder etc presented in this findings are popularly used as the tool to measure not only at national level but also at community development context. Such basic indicators are very important for policy maker, planner, especially commune councillors for formulating strategic community development plan toward reduction of the people's poverty.

We are councillors of all communes in entire Snuol district express pour high and sincere appreciation to those who contributed to CBMS such as responds, enumerators, supervisors, coders and editors, who paid their value busy time to provide accurate answers and work very hard until this great achievement appeared.

Deep thanks are also given to NIS, Technical Working Group of NIS: Mr. Try Sotearith, Team Leader; Mr. Kim Net, Researcher; and Mr. Nuon Nisay Kosal, Assistance Researcher; and CBMS Advisory Team.

Finally, thanks are due to every one of them who contributed to the great success of the “Facts of Poverty” of our community.

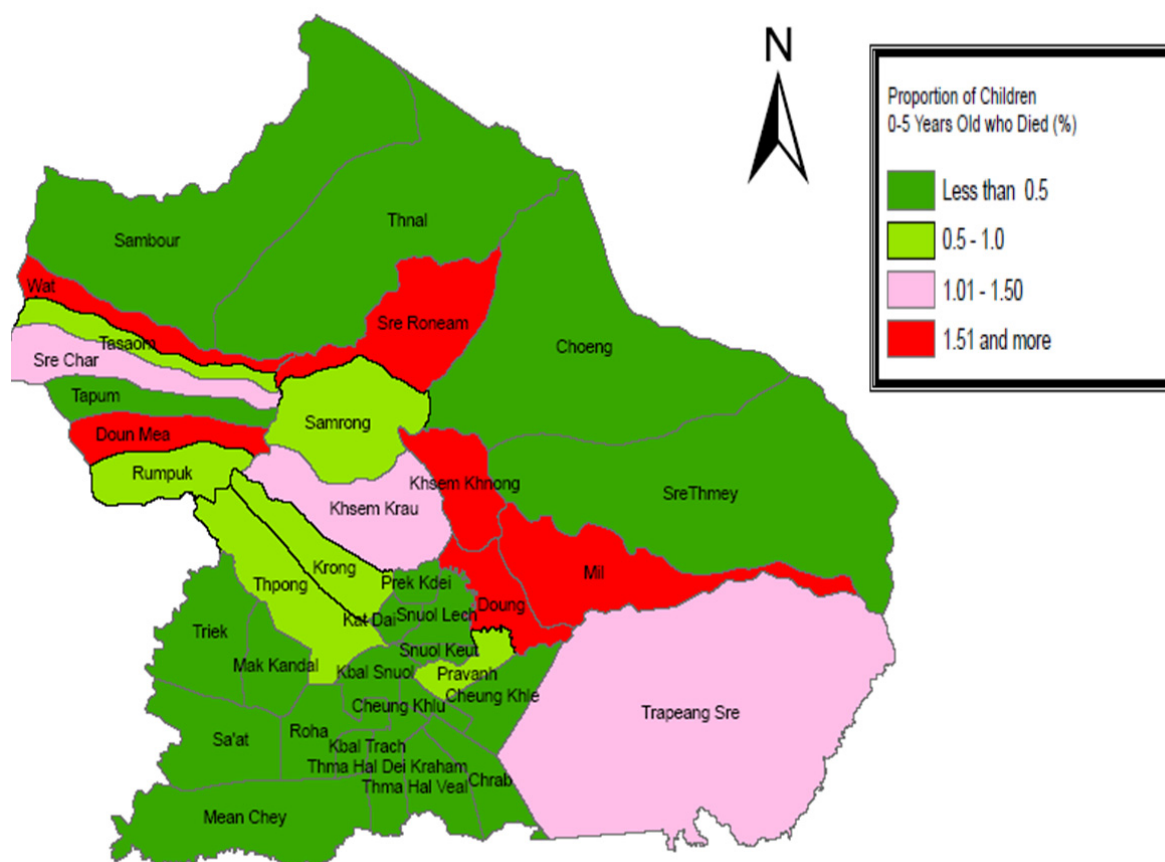

Head of Commune
